

Request for detailed explanations

Explain all these in detail with multiple examples and give real scenarios if possible

Sure, I can provide detailed explanations with examples and real-world scenarios — but I need to know **which topic(s)** or **list of items** you're referring to. Could you please clarify what “all these” means?

Here are some possibilities based on your previous queries:

- Java concepts (e.g., Generics, Strings, Collections, etc.)
- Servlet and JSP topics (e.g., `getParameter()`, `getSession()`, `Cookies`)
- Django (e.g., AJAX in registration form, ListViews, session handling)
- Image processing with OpenCV and Pyzbar
- Resume building
- Software Engineering concepts
- Spring Boot E-commerce or Quiz projects
- Google GenAI chatbot (Sweedney)

Please let me know exactly **which topics** you'd like me to explain in detail with examples and real scenarios. Once you confirm, I'll give you a thorough explanation!

Define VEEVA Systems

Define VEEVA CRM Architecture
 . Define VEEVA product Suites

Define Supported platforms for VEEVA CRM

Define VEEVA CRM language interface compatibility

Define Product upgrade and New feature releases

Here is a detailed explanation for each term related to **Veeva Systems** and its CRM offerings, with **real-world context**, **examples**, and **industry relevance**:

✓ 1. Define Veeva Systems

Veeva Systems is a **cloud-based software company** that provides specialized solutions for the **life sciences industry**, including pharmaceuticals, biotechnology, and medical device companies. Their

products help manage customer relationships, clinical trials, regulatory documentation, and product commercialization — all in compliance with industry regulations like FDA 21 CFR Part 11.

◆ Key Features:

- Industry-specific CRM (Customer Relationship Management)
- Content management
- Master data management
- Clinical data & operations
- Regulatory & quality management

💡 Real-World Use Case:

- A pharmaceutical sales rep from **Pfizer** uses **Veeva CRM** on their iPad to manage healthcare provider interactions, track product detailing, and log call notes during hospital visits.

✓ 2. Define Veeva CRM Architecture

Veeva CRM Architecture is a **multi-tenant cloud architecture** built on top of the **Salesforce.com platform**. Veeva customizes Salesforce to meet the specific needs of life sciences companies.

◆ Architectural Components:

Layer	Description
Application Layer	Built on Salesforce using Apex, Visualforce, Lightning components
Data Layer	Uses Salesforce's data model + Veeva-specific objects (e.g., Call, Account, CLM)
Integration Layer	API integrations with SAP, Oracle, HL7, etc.
Presentation Layer	Accessible via iPad app (Veeva CRM for iPad), web (Veeva CRM online), and mobile (Veeva CRM Mobile)
Security Layer	Role-based access, audit trails, FDA compliance features

💡 Example:

- **Veeva Vault** integrates with **Veeva CRM** to share approved marketing content (e.g., drug brochures) with field reps.

✓ 3. Define Veeva Product Suites

Veeva offers several product suites, each tailored for specific functions in the life sciences domain.

◆ Major Veeva Product Suites:

Suite	Description
Veeva CRM	Manage HCP (Healthcare Professional) interactions, field activities, sales force automation

Suite	Description
Veeva Vault	Cloud content management (e.g., document control, clinical trial documents)
Veeva Commercial Cloud	Combines CRM, content, and data to support product launch and marketing
Veeva MedComms	Medical communications, inquiry management
Veeva Nitro	Commercial data warehouse and analytics
Veeva OpenData	HCP and HCO (healthcare organization) master data
Veeva QualityOne	QMS (Quality Management System) and compliance tools
Veeva RIM	Regulatory Information Management system

💡 Scenario:

- A biotech company launching a new vaccine uses:
 - **Veeva CRM** for managing HCP engagement.
 - **Veeva Vault** to store FDA-compliant marketing content.
 - **Veeva Nitro** to analyze sales and market performance.

✅ 4. Define Supported Platforms for Veeva CRM

Veeva CRM is designed to run on **multiple platforms**, ensuring flexibility and accessibility for field teams.

♦ Supported Platforms:

Platform	Description
iOS (iPad, iPhone)	Most commonly used by sales reps for detailing and HCP visits
Web Browsers	Veeva CRM Online via browsers (Chrome, Safari)
Salesforce1 Mobile App	Supports certain Veeva CRM features
Offline Mode	Available on iPad for areas with low/no connectivity
Windows (limited)	Not a primary focus but web version works on Windows browsers

💡 Real Use Case:

- A sales rep in a remote area uses **Veeva CRM iPad App offline**, syncs data to cloud when back online.

✅ 5. Define Veeva CRM Language Interface Compatibility

Veeva CRM supports **multilingual interfaces** to cater to global users and sales teams.

♦ Language Compatibility:

- Supports over **30 languages**, including:
 - English

- French
- German
- Japanese
- Spanish
- Chinese (Simplified and Traditional)
- Portuguese (Brazilian)
- Russian
- Interface, data entry fields, and reporting can be localized.

Example:

- A global pharma company with teams in Japan, France, and the US can configure Veeva CRM in respective local languages for their reps.

6. Define Product Upgrade and New Feature Releases

Veeva follows a **regular release cycle**, delivering **three major product updates per year**, with **automatic cloud upgrades**.

◆ **Upgrade Schedule:**

- **Spring, Summer, and Winter** releases (aligned with Salesforce updates).
- Each release includes:
 - New features
 - Enhancements
 - Bug fixes
 - Security patches

◆ **Upgrade Characteristics:**

- **Automatic and cloud-based** (no manual installations required).
- Backward compatibility ensures existing customizations continue to work.
- Release notes and training are provided.

Example:

- In the **Summer Release**, Veeva adds AI-powered call recommendations for reps, which automatically becomes available to users after the upgrade.

Summary Table:

Feature	Summary
Veeva Systems	Cloud software for life sciences
CRM Architecture	Built on Salesforce, multi-layered
Product Suites	CRM, Vault, OpenData, Nitro, RIM, MedComms
Supported Platforms	iOS, Web, Salesforce1 Mobile
Language Interface	30+ global languages
Product Upgrades	3 times/year, auto-updated

If you'd like visuals, diagrams, or a comparison with Salesforce CRM, I can add those too.

Would you like a **PDF cheat sheet** summarizing all the points above?

Define typical VEEVA Administrator responsibilities

Visualize VEEVA CRM interface - look & feel

Access the main areas of Admin Console

Work with Identity configuration in VEEVA

Manage Company Information

Here is a **detailed explanation** of the topics related to **Veeva CRM Administration**, along with **examples**, **UI visualizations**, and **real-world relevance** where possible.

✓ 1. Define Typical Veeva Administrator Responsibilities

A **Veeva Administrator** manages the configuration, user access, data, and functionality of the Veeva CRM platform, ensuring it aligns with the needs of a **life sciences organization** (pharma, biotech, medical devices).

◆ Key Responsibilities:

Responsibility	Description
User Management	Create, deactivate, or manage licenses for users (e.g., sales reps, MSLs)
Territory Management	Assign HCPs and Accounts to reps based on geography or specialty
Multichannel Cycle Planning	Set up targeting, call goals, and campaigns for field reps
Content Management (CLM)	Upload, approve, and assign approved content (e.g., drug brochures) to sales teams
Object & Field Configuration	Customize Veeva objects (Call, Account, Medical Inquiry) and fields using Salesforce tools
Integration Support	Connect Veeva with SAP, MDM, ERP, or external content repositories

Responsibility	Description
Compliance & Audit Logs	Ensure the system complies with 21 CFR Part 11 and maintains secure access logs
Release Testing	Validate new features and regression test in Sandbox before production upgrades

💡 Example:

A Veeva Admin configures a **new product launch** workflow to:

- Add a new drug in the product catalog
- Assign new call objectives
- Set up content in Vault
- Sync it to the reps' iPads

✅ 2. Visualize Veeva CRM Interface – Look & Feel

The **Veeva CRM interface** is highly polished and is optimized for **iPads** and **Salesforce Web UI**. It mirrors a **pharmaceutical field rep's workflow**.

♦ Interface Components:

➤ iPad (Field Sales Reps)

- **Homepage Tiles:** Quick access to Calls, Accounts, CLM, Calendar
- **Call Screen:** Log activities, samples, discussions
- **CLM (Closed Loop Marketing):** Tap to present approved slides/content
- **Offline Mode:** Syncs later when internet is available

➤ Web Admin (Salesforce Interface)

- **Tabs:** Accounts, Calls, Reports, Products, Surveys, Content
- **Lightning UI:** Drag-and-drop dashboards, app launcher, data tables
- **Admin Console Access:** Manage users, data, configurations

💡 Screenshot (imagined layout):

less

```
+-----+
| Home | Accounts | Calls | Reports | Setup |
+-----+
| [Search Bar] |
| [Calendar Widget] [Call Targets] [Reports] |
| [Recent HCPs] [Performance Scorecard] |
+-----+
```

✅ 3. Access the Main Areas of Admin Console

The **Admin Console** is accessed via **Salesforce Setup** (as Veeva is built on Salesforce).

◆ Key Admin Console Areas:

Section	Purpose
Users	Add, deactivate users; assign profiles and roles
Profiles & Permission Sets	Define access levels to Veeva objects
Objects and Fields	Customize CRM data model (e.g., Call, Account, CLM Presentation)
Page Layouts	Modify UI for different roles (rep vs. manager)
Workflow Rules	Automate approvals, notifications, field updates
Territory Management	Map accounts to field reps by region or specialty
Multichannel Settings	Configure CLM, Email Templates, Approved Emails

💡 Example:

If a new HCP specialty (e.g., "Geneticist") needs to be tracked, the admin adds a new **picklist value** in the "Specialty" field on the Account object.

✓ 4. Work with Identity Configuration in Veeva

Identity Configuration in Veeva refers to how user identities are authenticated, provisioned, and managed securely — often tied into **Salesforce Identity** and **SSO (Single Sign-On)**.

◆ Components:

Element	Description
Single Sign-On (SSO)	Integrate with corporate LDAP/Active Directory
Federation	Support for SAML 2.0 for identity federation
Two-Factor Authentication (2FA)	Optional for added security
Login History & IP Ranges	Control where and how users can log in
MyVeeva ID	Veeva's patient identity management (used in clinical or health platforms)

💡 Example:

A Veeva admin enables **SSO for field reps**, allowing them to log in using their company credentials instead of separate Veeva credentials.

✓ 5. Manage Company Information

This involves managing **organizational settings, branding, compliance, and territory hierarchy**.

◆ Key Settings in "Company Information":

Setting	Description
Company Name & Address	Visible in Veeva reports and dashboards
Default Language & Locale	Controls currency, date formats, and language
License Management	Track number of available Veeva licenses
Fiscal Year Settings	Important for aligning sales cycle planning
Business Units/Divisions	Used to separate access and reporting for different product lines
Territory Hierarchy	Align field teams with HCPs/HCOs by region, specialty, or business unit

💡 Example:

A company with two divisions – **Oncology** and **Cardiology** – can configure Veeva so that each sales team only sees data and reports relevant to their division.

✓ Summary Table

Area	Description	Real Example
Veeva Admin Role	Manages users, data, config	New product rollout setup
CRM Interface	iPad app + Web-based CRM	Sales rep logs call from iPad
Admin Console	Setup, config, rules	Add new field to Call object
Identity Configuration	SSO, 2FA, Federation	Enable company login credentials
Company Info	Org settings, hierarchy	Set up Oncology & Cardiology teams separately

Would you like a **visual admin flowchart** or a **step-by-step guide** to using Salesforce Setup for Veeva CRM? I can prepare one for training or documentation purposes.

Define Salesforce.com Data Access Security

I

Describe the 9 types of mechanisms for securing data acces

Create and Manage User Accounts

Let's break down your request into **three parts**, all related to **Salesforce.com Data Access Security**, especially in the context of **Veeva CRM**, which is built on Salesforce.

✓ 1. Define Salesforce.com Data Access Security

Salesforce.com Data Access Security refers to a **multi-layered approach** to control who can access what data, at what level, and how they can interact with it (view, edit, delete, share).

Salesforce ensures that the **right users** see the **right data** without compromising **confidentiality, compliance, or integrity**, which is especially important in regulated industries like life sciences (e.g., Veeva clients).

🔒 Three Main Levels of Data Security in Salesforce:

Level	Description	Example
Object-level	Can the user access the object (e.g., Accounts, Contacts)?	Reps can access "Call" object but not "Medical Inquiry" object
Field-level	Can the user see/edit specific fields within the object?	Reps can view "Doctor's Specialty" but not edit it
Record-level	Can the user access specific records (rows)?	Rep A can see only doctors in their territory

✅ 2. Describe the 9 Types of Mechanisms for Securing Data Access

Here are **9 key mechanisms** Salesforce provides to secure data access:

◆ 1. Profiles

- Control access to objects, fields, and system permissions.
- Every user has one profile.

Example:

- A Sales Rep profile allows read/write access to "Call" and "Accounts" objects.

◆ 2. Permission Sets

- Grant additional permissions to users on top of their profiles (without changing the profile).
- Flexible and reusable.

Example:

- Give a rep temporary "Edit Product Catalog" access without editing their profile.

◆ 3. Organization-Wide Defaults (OWD)

- Set baseline record-level access (e.g., Public Read-Only, Private).
- Determines what users can see if no sharing rules apply.

Example:

- Set "Call" object to Private so reps only see calls they created.

◆ 4. Role Hierarchies

- Allow higher roles to access records owned by users lower in the hierarchy.

Example:

- A regional sales manager can see all reps' calls in their region.
-

◆ 5. Sharing Rules

- Grant access to groups or roles beyond what OWD and roles provide.

Example:

- Share all oncology-related accounts with the Oncology Marketing team.
-

◆ 6. Manual Sharing

- Let users manually share individual records (if permitted).

Example:

- A rep shares a high-value doctor's record with a colleague covering their leave.
-

◆ 7. Field-Level Security (FLS)

- Restrict visibility or editability of individual fields.

Example:

- Hide "HCP License Number" from non-manager users.
-

◆ 8. Record Types & Page Layouts

- Customize record creation flow and UI based on user role or profile.

Example:

- MSLS see a different call layout than sales reps.
-

◆ 9. Login IP Ranges & Login Hours

- Restrict when and where users can log in.

Example:

- Reps can log in only between 8 AM – 6 PM and only from corporate IPs.
-

3. Create and Manage User Accounts

Creating and managing users is a fundamental admin task to enforce secure, role-based access.

Steps to Create a User in Salesforce:

1. Go to **Setup** → Search **"Users"** → Click **"Users"**
2. Click **"New User"**
3. Fill in:
 - First Name, Last Name, Email, Username (must be unique)
 - Role (e.g., Sales Rep – East)
 - Profile (e.g., Veeva CRM Field User)
 - Locale settings (Time zone, Language)
4. Check **"Generate new password"**
5. Click **Save**

Managing Existing Users:

Task	Description
Deactivate	Remove access without deleting data
Reset Password	For users who forget credentials
Change Role/Profile	Reassign based on territory moves
Freeze User	Temporarily lock access (used before deactivating)
Login History	Monitor login attempts, IPs, and timestamps
Assign Permission Sets	Grant additional access without modifying profile

Real Scenario:

A new oncology rep joins your pharma company. The Veeva Admin:

- Creates a Salesforce user
- Assigns the **Sales Rep – Oncology** role
- Grants access to **Approved Email** via Permission Set
- Assigns the rep to **East Coast territory**
- Ensures they can only view accounts in their region

Summary Table

Concept	Purpose	Real Example
Profiles	Define base access	Reps can read/write Calls
Permission Sets	Add specific rights	Temporary CLM edit rights

Concept	Purpose	Real Example
OWD	Baseline record visibility	Accounts = Private
Roles	Inherit record access	Managers see reports' calls
Sharing Rules	Extend record access	Share Cardiology doctors with marketing
Manual Sharing	Share one-off records	Rep shares one HCP
FLS	Field visibility control	Hide sensitive license data
Record Types/Layout	UI/flow customization	MSLs vs Reps views
Login Controls	IP/time restrictions	Only log in during work hours

Would you like me to prepare a **Veeva Admin Security Checklist** or a **Salesforce Data Access Decision Tree** to visualize these rules in one diagram?

Explore User Interface Settings

Search Features

Customize Home Tab Page Layout

Manage Translations

Here's a detailed explanation of each of the requested topics related to **Salesforce / Veeva CRM user interface customization and localization** — with examples, UI walkthroughs, and real-world relevance.

✓ 1. Explore User Interface Settings

User Interface Settings in Salesforce (and by extension in Veeva CRM) allow administrators to customize the **look, feel, and behavior** of the application to suit users' needs.

◆ How to Access:

- Go to **Setup** → Search **"User Interface"** → Click on **User Interface**

◆ Key UI Settings:

Setting	Description	Example
Enable Collapsible Sections	Allows users to collapse sections on records	A rep collapses the "Sample History" section on the HCP page
Show Quick Create	Enables fast record creation from sidebar	Quickly create a new Account or Contact
Enable Hover Details	Shows a pop-up summary when hovering over a record link	Hover over an HCP name to preview specialty
Use Inline Editing	Allows editing directly in list views	Update status of multiple HCPs from a report

Setting	Description	Example
Enable Related List Hover Links	Shows related records in pop-up	Hover over "Calls" to preview call history
Use Tabbed UI for Record Pages	Displays record details in tabs	Tabs like Details

💡 Real Use Case:

For mobile sales reps using Veeva CRM on iPads, enabling **tabbed record view** and **hover details** simplifies navigation and speeds up data access during hospital visits.

✅ 2. Search Features in Salesforce / Veeva CRM

Salesforce offers powerful search tools to help users **quickly locate records**. In Veeva, this applies to HCPs, accounts, products, etc.

◆ Key Search Features:

Feature	Description
Global Search	Main search bar at the top of the interface
Instant Results	Autocomplete shows matching records as you type
Object-specific Search	Use tabs (e.g., "Accounts") to limit search scope
Advanced Search Filters	Filter by fields like Name, Specialty, Territory
Search Layouts	Admins can define which fields appear in search results
Search Personalization	Users can pin frequently used records for quick access

◆ Configuration:

- **Setup** → Search **"Search Settings"**
- Select objects like "Account", "Call", "CLM Presentation"
- Define fields to display in search results (e.g., Name, Specialty, Region)

💡 Real Use Case:

A rep types "Dr. Smith" in the Global Search bar. Instant results show all matching doctors. The search layout shows Specialty, Location, and Last Call Date, helping the rep pick the right record.

✅ 3. Customize Home Tab Page Layout

The **Home Tab** in Salesforce is the first screen users see after logging in. Customizing it helps users focus on what's important.

◆ How to Customize:

1. Go to **App Manager** → Find the relevant App (e.g., Veeva CRM)

2. Click **Edit** → Go to **App Settings**
3. Set a **custom Home tab** or use **Lightning App Builder**

◆ Elements to Add:

Component	Purpose
Today's Tasks	Show pending follow-ups or sample requests
My Accounts	Shortcut to frequently visited HCPs
Call Goals Widget	Show weekly/monthly visit targets
Reports Dashboard	Visual KPI charts (Calls, CLM views, Approved Emails)
Announcements	Show internal memos or compliance reminders
Upcoming Events	Sync with calendar or Veeva events module

💡 Real Use Case:

For a rep, the customized Home Tab displays:

- **Top 10 Targeted HCPs**
- **Call Targets Progress Bar**
- **Recently Viewed Records**
- **Quick Create Call Log Button**

This boosts productivity and ensures data is logged promptly.

✅ 4. Manage Translations

Salesforce Translation Workbench supports multiple languages, allowing admins to **translate object names, fields, picklists, custom labels**, and UI text — ideal for Veeva's global pharma clients.

◆ How to Enable & Configure:

1. Go to **Setup** → Search "**Translation Workbench**"
2. Click **Enable**
3. Add Supported Languages (e.g., French, German, Japanese)
4. Assign translators by language
5. Use **Translate** menu to manage translations

◆ What You Can Translate:

Component	Translatable?
Object Names & Labels	✓
Picklist Values	✓
Field Labels	✓

Component	Translatable?
Custom Labels (used in Visualforce, Apex)	✓
Error Messages & Validation Rules	✓

Example:

In a French-speaking region:

- “Call” object becomes **“Visite Médicale”**
- Picklist value “High Priority” becomes **“Haute Priorité”**
- “Account” becomes **“Professionnel de Santé”**

This localization improves user adoption and reduces training overhead.

Summary Table

Feature	Purpose	Real Use Case
User Interface Settings	Customize UI behaviors and interactions	Collapsible sections for better iPad navigation
Search Features	Quickly locate records	Instant result previews of HCPs and Accounts
Customize Home Tab	Tailor homepage to user role	Display call targets, reports, and calendar on login
Manage Translations	Enable multilingual UI	Translate objects and picklists for global reps

Would you like a **visual layout of the Home Tab** or a **step-by-step translation guide (PDF or table format)** to use as a reference for training or deployment?

Describe how VEEVA Settings are used

Describe various fields of a VEEVA Message Record

Create a custom VEEVA Message

Identify the uses and best practices for VEEVA Marker Field

Here is a detailed breakdown of the requested Veeva CRM topics, particularly from an **admin configuration and functional usage** standpoint, including **examples, real use cases, and best practices**.

1. Describe How Veeva Settings Are Used

◆ What Are Veeva Settings?

Veeva Settings are **custom configuration parameters** used to control and tailor the behavior of various **Veeva CRM features**. These settings are stored in a custom metadata object called **Veeva Settings**, and they determine how functionality such as CLM, Approved Email, Medical Events, and more behaves in the org.

♦ How to Access:

- Salesforce Setup → Search for **Veeva Settings**
- Or via Veeva tab called “**Veeva Configuration**”

♦ Common Examples of Settings:

Setting Key	Description	Example
CLM_Enable_Capture_Signature	Controls whether eSignatures are required during a CLM presentation	TRUE for reps in US region
Approved_Email_From_Address	Default sender email address for approved emails	noreply@pharma.com
Sample_Limit_Per_Call	Restricts how many samples can be recorded per HCP call	5 samples per call
Consent_Capture_Enabled	Enables HCP consent tracking for emails	TRUE in EU due to GDPR

💡 Real-World Use Case:

For compliance in **EU regions**, an admin enables **Consent_Capture_Enabled = TRUE**, ensuring reps capture consent before sending promotional emails.

✅ 2. Describe Various Fields of a Veeva Message Record

A **Veeva Message** is a system-generated or admin-configured **message or error/warning text** that appears in the user interface — often during validations, workflows, or record creation.

♦ Fields of a Veeva Message Record:

Field Name	Description	Example
Name (API Name)	Unique identifier (used in code)	REQUIRED_FIELD_MISSING
Text	Actual message shown to the user	“Please enter the HCP Specialty.”
Language	Language code (e.g., EN, FR)	EN (English)
Type	Where the message is used	Validation, Warning, Info
Active	Whether this message is currently active	TRUE
Display Location	UI placement	Top of Page, Field-level
Product Type (optional)	Used for product-specific messages	“Oncology” only
Region or Country (optional)	Target message by region	US, EU, JP

💡 Example:

During a Call entry, if the “**Samples**” section is left blank for a required product, the system may show:

- Message Name: **MISSING_SAMPLE_ERROR**
- Text: "You must add at least one sample for this product."
- Type: Error

✓ 3. Create a Custom Veeva Message

◆ Steps to Create:

1. Go to **App Launcher** → Search for **Veeva Messages**
2. Click **New**
3. Fill in the fields:
 - **Name:** **EMAIL_CONSENT_REQUIRED**
 - **Text:** "You must capture email consent before sending an Approved Email."
 - **Language:** EN
 - **Type:** Error or Warning
 - **Display Location:** Top of Page
 - **Active:** Checked
4. **Optional Filters:**
 - Region = "EU"
 - Product Type = "Vaccines"
5. Click **Save**

💡 Real Use Case:

Before sending an email to HCPs in Europe, a custom error message is shown if no consent has been recorded — aligning with GDPR compliance.

✓ 4. Identify the Uses and Best Practices for Veeva Marker Field

◆ What is a Veeva Marker Field?

A **Veeva Marker Field** is a special field used to **track changes** to a record or field value. It's commonly used in data integration scenarios or to trigger syncs, workflow actions, or reporting filters.

◆ Common Uses:

Use Case	Description
Integration Sync	Mark which records have changed since the last sync
Approved Email Consent	Track last consent update
Activity Flag	Flag a record for follow-up or additional processing
Trigger Automation	Used in Apex triggers or Process Builder to fire logic only on certain changes

◆ Best Practices:

Practice	Description
✓ Use Boolean or Timestamp Fields	Simple to evaluate for logic
✓ Name Fields Clearly	e.g., Is_Updated_For_Sync__c or Consent_Updated__c
✓ Reset After Processing	If used for one-time flags, clear the marker after the job completes
✓ Avoid Overuse	Keep marker logic clean and limited to essential workflows
✓ Use in Reports	Filter “where marker = TRUE” for operational reporting

💡 Real Use Case:

You create a custom field **SampleData_Updated__c** (checkbox) on the **Call** object. When a sample is logged or updated, this field is checked, which flags it for an external sync process. After syncing, a batch job clears the marker.

✓ Summary Table

Topic	Purpose	Example
Veeva Settings	Control system behavior	Limit samples per call, enable CLM features
Veeva Message Record	Display custom messages to users	"Please select a product before submitting the call."
Custom Veeva Message	Provide user guidance/errors	Warn if email consent not captured
Veeva Marker Field	Track data changes or trigger logic	Flag updated records for sync

Would you like a **sample configuration template (Excel)** to track all your Veeva Settings, Messages, and Marker Fields for documentation and compliance purposes?

Define 'My Accounts'

Create Views

Create Lists

I

Configure the My Accounts tab:

Hide the Mass Update button

Configure the Schedule a Call button

Configure the New button:

Enable New Account Wizard

Enable Parent Account Wizard

Use the VEEVA Global Account Search

Describe My Accounts on CRM (iRep)

My Accounts tab is one of the most customized VEEVA tab. This is a custom VEEVA User Interface runs on VEEVA servers

This tab can bring and show data from 4 objects in a single view - Accounts, Address, Product Metrics, Territory Fields

My accounts tab is being used to view and manage customers for end users

Great! Let's explore the **"My Accounts" tab** in Veeva CRM in **full detail**, covering its purpose, configuration, UI behavior, and real-world examples — especially as it relates to **iRep (Veeva CRM on iPad)** and the **Salesforce web interface**.

✓ 1. Define 'My Accounts'

The **"My Accounts" tab** in Veeva CRM is a **custom, highly-configurable tab** used by sales representatives, MSLs, and other field teams to **view, filter, and manage HCPs (Healthcare Professionals) and HCOs (Healthcare Organizations)** assigned to their **territory**.

It combines data from **multiple related objects** in a **single user interface** hosted on **Veeva's servers**, and is tailored specifically for **life sciences field workflows**.

✓ 2. Core Features of My Accounts

Feature	Description
Consolidated View	Shows HCPs with linked Address, Product Metrics, and Territory Info in one grid
Search & Filter	Enables dynamic filtering by name, specialty, location, etc.
Call Scheduling	Directly create calls or schedule visits from the same interface
Custom Buttons	"New", "Schedule a Call", "More Actions", etc.
Responsive Layout	Optimized for both iRep (iPad) and Web
Configurable	Admins can control columns, buttons, filters, and behavior

✓ 3. Create Views and Lists in My Accounts

◆ Views:

- **Views** are saved filters or groupings.

- Reps can toggle between views such as:
 - "All My HCPs"
 - "Cardiologists"
 - "Call Targets"
 - "Top Prescribers"

► How to Create a View:

1. Click **"Add View"** or **"Customize View"**.
2. Choose filters (e.g., Specialty = Cardiologist, Zip Code = 94109).
3. Name the view and click **Save**.

♦ Lists:

- **Lists** are the result set shown for a selected view.
- Each row represents an Account and includes fields like:
 - Name
 - Address
 - Specialty
 - Call Frequency
 - Product Adoption Metrics

4. Configure the My Accounts Tab

♦ a) Hide the Mass Update Button

Mass Update allows bulk changes, but it may be disabled to prevent unintended edits.

► To Hide:

- Go to **Veeva Settings** or **Custom Metadata (MyAccountsConfig)**
- Set: `Show_Mass_Update_Button = FALSE`

♦ b) Configure the "Schedule a Call" Button

This button allows the rep to **quickly plan a future call** for a selected HCP.

► Configuration:

- Enable via Veeva config: `Enable_Schedule_Call_Button = TRUE`
- Optionally pre-populate fields like:

- Location = Preferred Address
- Product = Assigned Product Line
- Call Objective = "Planned Visit"

◆ c) Configure the "New" Button

This button controls how **new Accounts** are created from My Accounts.

Options:

Feature	Description
Enable New Account Wizard	Step-by-step guide to create a new HCP with address and specialty
Enable Parent Account Wizard	Used to create parent HCOs (e.g., hospitals, clinics) linked to HCPs

► How to Enable:

- From Veeva Settings / Admin Console:
 - `Enable_New_Account_Wizard = TRUE`
 - `Enable_Parent_Account_Wizard = TRUE`

💡 Real-World Example:

A rep in the field opens the app, taps "New", and is guided through:

1. Selecting HCP type
2. Entering NPI, Specialty, Region
3. Linking to a clinic (parent account)

◆ d) Use the Veeva Global Account Search (VGAS)

VGAS allows reps to **search across the global database** of accounts before creating new ones, to **prevent duplicates**.

► Features:

- Search by NPI, name, license number, city, zip code
- Displays **local** and **global matches**
- Option to **Request Account Merge** or **Add to Territory**

► How to Enable:

- From Veeva Settings:
 - `Enable_Global_Account_Search = TRUE`
 - Region or country-specific filters can also be set

💡 Use Case:

Before adding a new HCP named “Dr. John Kim,” the rep is required to search VGAS. The system shows that Dr. Kim already exists in another rep's territory. The rep can then **request access** instead of duplicating the record.

✅ 5. My Accounts on CRM (iRep / iPad)

My Accounts on iRep is **one of the most frequently used tabs** on the Veeva CRM iPad app. It provides a **territory-centric, action-oriented** view of HCPs.

◆ Key Features:

Feature	Description
Touch-friendly Grid UI	Optimized for tablets with swipe, tap, filters
Offline Access	Data available without internet; syncs later
Call Scheduling	Tap an account to instantly log or schedule a call
Interactive Filters	Filter by product coverage, last call date, or specialty
Smart Alerts	Visual cues for call due, new content, compliance flags

💡 Real-World Workflow:

- A rep starts their day on iPad:
 1. Opens **My Accounts**
 2. Filters for “**Due Calls This Week**”
 3. Taps an HCP
 4. Sees last interaction, content shared, and call notes
 5. Schedules a follow-up or initiates a CLM presentation

✅ 6. Integration of 4 Objects in One View

The **My Accounts tab** can display and link data from the following objects:

Object	Description
Account	HCP or HCO master record
Address	Multiple addresses tied to an HCP
Product Metrics	Prescription data, target scores, segmentation
Territory Fields	Flags and access controls based on rep's region

✅ Summary Table

Topic	Description
My Accounts	Veeva's main interface to manage customers (HCPs/HCOs)
Views/Lists	Saved filters (views) and displayed records (lists)
Schedule a Call	One-click call planning button
New Account Wizard	Guided workflow to add new HCPs or HCOs
VGAS	Prevents duplicate HCP creation via global search
iRep Support	Optimized for iPad, offline use, fast access
4 Object View	Account + Address + Product Metrics + Territory Info

Would you like a **UI mockup** of the My Accounts tab or a **configuration checklist** for deployment/testing? I can provide those next!

Define VEEVA Account record types

Define custom Accounts fields

Create custom page layout and record types

Create a custom Account button

Display the View User Territory custom link

Let's break down all your requested Veeva CRM configuration tasks in detail, with clear **definitions**, **examples**, and **real-world use cases** — specifically related to **Accounts** in the life sciences CRM setting.

✓ 1. Define Veeva Account Record Types

In **Veeva CRM (built on Salesforce.com)**, **record types** are used to categorize **Account records** by type — especially when different kinds of customers need to store **different data** or use **different page layouts**.

♦ Common Account Record Types:

Record Type Name	Description	Example
Professional	Represents an individual HCP (e.g., doctor, nurse)	Dr. Sarah Kim, Cardiologist
Business_Professional	HCPs associated with HCOs (e.g., clinic-affiliated doctors)	Dr. John Lee at "Sunrise Clinic"
Hospital / HCO	Healthcare organization or institution	Sunrise Hospital
Pharmacy	Retail or wholesale pharmacy	CVS, Walgreens
Distributor	Distributor accounts	McKesson
Custom Type (e.g., KOL)	Custom account type (e.g., Key Opinion Leader)	Dr. Rakesh Rao, KOL for Cardiology

✓ 2. Define Custom Account Fields

Custom fields are used when the default Salesforce/Veeva fields do not capture all the data your organization needs.

◆ Examples of Custom Fields:

Field Name	Data Type	Description
Prescriber_Status__c	Picklist	Active / Inactive / Suspended
Specialty_Code__c	Text	Stores medical specialty code
Target_Score__c	Number	Account prioritization value
Visit_Frequency__c	Picklist	Weekly / Monthly / Quarterly
KOL_Flag__c	Checkbox	Marks account as a Key Opinion Leader
Affiliated_HCOs__c	Lookup (Account)	Links to hospitals or clinics

💡 **Real-World Use Case:** Reps may want to know if an HCP is a **KOL** and **how often** they should be visited — custom fields can track this.

✓ 3. Create Custom Page Layout and Record Types

Page Layouts control the **UI arrangement** of fields, buttons, related lists, and sections.

◆ Steps to Create a Custom Record Type and Layout:

➤ a) Create Record Type

1. Navigate to **Setup > Object Manager > Account > Record Types**
2. Click **New Record Type**
3. Set name: e.g., **Hospital_Record_Type**
4. Choose applicable profiles (e.g., only for Hospital Reps)
5. Save

➤ b) Create Page Layout

1. Go to **Setup > Object Manager > Account > Page Layouts**
2. Click **New** or Clone an existing layout
3. Add/remove sections and custom fields as needed
 - e.g., show **"Bed Capacity"**, "Hospital Type" for hospitals
 - hide **"License Number"** for HCOs
4. Save and assign layout to your new record type

➤ c) Assign Layouts to Record Types

1. Under **Page Layout Assignment**
2. Map **Hospital Layout** to **Hospital Record Type**, and so on

✓ 4. Create a Custom Account Button

Custom buttons are created to **extend functionality**, such as launching wizards, redirecting to external apps, or triggering JavaScript logic.

◆ Use Cases:

- “Create Sample Request” button
- “Launch Call Report”
- “Navigate to External Profile” (e.g., Open FDA registry)

◆ Steps:

1. Go to **Setup > Object Manager > Account > Buttons, Links, and Actions**
2. Click **New Button or Link**
3. Choose **Detail Page Button**
4. Set name: **View_Prescription_History**
5. Choose behavior: **Display in New Window**
6. Content Source: **URL**
 - Example URL:

```
arduino
```

```
https://external-pharma.com/history?hcp_id={!Account.Id}
```

7. Save and add this button to the Account page layout.

✓ 5. Display the View User Territory Custom Link

This feature allows users to view which **territories a given Account is part of**, especially useful for managing **multi-territory overlap**.

◆ How it Works:

- Shows a **list of users/territories** associated with an Account.
- Often implemented as a **custom link** calling a **Visualforce page** or **Lightning component**.

◆ How to Configure:

➤ a) Create Custom Link:

1. Go to **Account > Buttons, Links, and Actions**
2. Click **New Button or Link**
3. Label: **View User Territory**
4. Behavior: **Display in New Window**
5. URL Formula (example):

```
apex

/apex/UserTerritoryView?id={!Account.Id}
```

Or using a custom component/Lightning App.

► b) Add to Layout:

1. Open **Page Layout** for the relevant record type
2. Add the button under **Custom Links** section
3. Save and assign

✓ Real-Life Scenario

Pharmaceutical Use Case:

Let's say your field force includes:

- **Hospital Reps**
- **Retail Pharmacy Reps**
- **Oncology Specialists**

You might configure:

- **Record Types:** Professional, Hospital, Pharmacy
- **Custom Fields:** Specialty, Therapy Area, Visit Frequency
- **Custom Layouts:** Separate fields for HCP vs. HCO
- **Custom Buttons:** "Schedule Call", "Send Sample Request"
- **User Territory View:** To help managers validate rep coverage

✓ Summary Table

Feature	Purpose
Account Record Types	Categorize Accounts into HCPs, HCOs, Pharmacies, etc.
Custom Fields	Capture specific data for business processes
Page Layouts	Define UI experience per record type

Feature	Purpose
Custom Buttons	Add quick actions (wizards, external apps, reports)
User Territory Link	View which territories the account belongs to

Would you like me to create a **mock configuration sheet**, **XML metadata reference**, or **Visualforce sample** for any of these features?

Define the s-Control: 'Sphere of Influence', which represents the Account affiliations in a pictorial format & Configure the Affiliations

Define the Parent Child Relationship through Account Hierarchy & Configure an Account Hierarchy

Let's dive into the '**Sphere of Influence**' s-Control and **Account Hierarchies** in **Veeva CRM**, especially as they relate to real-world pharmaceutical use cases. These are essential for managing complex **HCP-HCO** relationships and **affiliations** in a visually intuitive way.

✓ 1. Define the s-Control: Sphere of Influence

◆ What is Sphere of Influence?

The **Sphere of Influence** in Veeva is a **custom s-Control** (older Salesforce technology) or **Visualforce page** that provides a **graphical view** of **affiliations and relationships** between:

- HCPs (Healthcare Professionals)
- HCOs (Healthcare Organizations)
- Pharmacies, Clinics, Distributors, etc.

It shows **how accounts are interconnected**, such as:

- A doctor affiliated with multiple hospitals.
- A KOL influencing other HCPs.
- A clinic that's part of a hospital group.

◆ Real-World Example:

Dr. Smith is:

- Affiliated with City Hospital
- Prescribes for Sunrise Clinic
- Influenced by KOL Dr. Allen

This network would be shown as a **node graph**, with Dr. Smith in the center and connections radiating to the affiliated accounts.

✓ 2. Configure Affiliations

Affiliations are stored in the **Affiliation object** in Veeva CRM. This object maps **relationships between Account records**.

◆ Steps to Configure Affiliations:

➤ a) Enable/Use the Affiliation Object:

- Object: **Affiliation__c**
- Fields:
 - **From_Account__c**: Source Account (e.g., HCP)
 - **To_Account__c**: Related Account (e.g., HCO)
 - **Relationship_Type__c**: e.g., Employed By, Admits To, Prescribes At
 - **Strength__c**: Level of influence or interaction
 - **Active__c**: True/False
 - **Start_Date__c**, **End_Date__c**: Optional

➤ b) Create Affiliation Records:

- Go to Dr. Smith's Account.
- Navigate to **Affiliations Related List**.
- Add a new affiliation:
 - From: Dr. Smith
 - To: City Hospital
 - Relationship: Employed By

➤ c) Display on UI:

- Use the **Sphere of Influence s-Control** or a **custom Lightning component** to display relationships.
- Alternatively, use Veeva's **prebuilt visual tree** component.

✓ 3. Define Parent-Child Relationship via Account Hierarchy

◆ What is an Account Hierarchy?

Account hierarchy lets you **structure accounts** in a **parent-child** format.

E.g., **Sunrise Health Group** is the **parent** of:

- Sunrise Hospital
- Sunrise Clinic
- Sunrise Oncology Center

This structure is displayed in a **tree view** from any Account page.

◆ Use Cases:

- A field rep can view all HCOs under a large hospital group.
- Managers can analyze sales coverage by corporate hierarchy.

✓ 4. Configure an Account Hierarchy

◆ Key Field:

- **ParentId** (on Account): This standard field links one Account as the **child** of another.

◆ Steps:

➤ a) Create/Update Records:

1. Go to **Sunrise Hospital** Account.
2. Set the **Parent Account** field to **Sunrise Health Group**.

➤ b) View the Hierarchy:

1. Open **Sunrise Health Group** Account.
2. Click "**View Hierarchy**" button (standard Salesforce feature).
 - Shows a **tree**: parent on top, children nested below.
3. Veeva can enhance this view with custom styling or limits (e.g., 5 levels deep).

➤ c) Customize Page Layout:

- Add the "**Parent Account**" field.
- Add the "**View Hierarchy**" button if missing.
- Add **custom links** like "Expand All Children" using Apex/Visualforce if needed.

✓ Summary Table

Feature	Purpose	Object/Field	Visualization
Sphere of Influence	Show relationships between HCPs/HCOs	Affiliation__c	s-Control / Lightning graph
Affiliations	Define one-to-one relationships between Accounts	Affiliation__c	Related List + Graph

Feature	Purpose	Object/Field	Visualization
Account Hierarchy	Define parent-child relationship between Accounts	ParentId (Account)	Tree view in UI

✓ Real-World Pharma Use Case

Dr. Angela, a high-priority HCP:

- Works at **Apollo Hospital**
- Is influenced by **Dr. Mehra (KOL)**
- Prescribes at **HealthFirst Clinic**

The **Sphere of Influence** will graph all her affiliations so a rep can plan targeted calls. Meanwhile, **Apollo Hospital** is under **Apollo Health Group**, visible through **Account Hierarchy**, helping regional managers plan corporate coverage.

Would you like a **custom JSON-based representation**, **Visualforce page sample**, or a **Lightning Web Component snippet** for displaying the Sphere of Influence or Account Hierarchy?

Define VEEVA Sample Management Data Model

Define Sample Lot and Lot Catalog

Explain various Sample Transactions

Describe My Samples Tab

Describe Sample Limit

I

Let's go through each concept of **Veeva CRM Sample Management** in detail. Sample Management is a core functionality in Veeva used to manage **regulated product distribution** (like drug samples) to **HCPs**, ensuring **compliance with industry laws** (like PDMA, Sunshine Act, etc.).

✓ 1. VEEVA Sample Management Data Model

◆ What is it?

Veeva's **Sample Management Data Model** consists of a set of **objects** that track:

- What product samples exist,
- Where they are stored,

- Who received them,
- The quantity and lot number, and
- Compliance rules (limits, signatures, licenses, etc.).

◆ Core Objects:

Object	Description
Sample_Transaction_vod__c	Tracks sample activities: disbursement, inventory, transfer, etc.
Sample_Lot_vod__c	Defines specific lots of sample products (with lot number, expiry, etc.)
Sample_Lot_Catalog_vod__c	Defines available lots per product and user region
Product_vod__c	The master product record (sample or promotional)
Inventory_Location_vod__c	Location where samples are stored
Sample_Inventory_vod__c	Links users and current inventory per product/lot
Call2_vod__c	Call record (HCP interaction) where samples are disbursed
Sample_Transaction_Audit_vod__c	Audit log for sample activities
State_License_vod__c	HCP licensing data for sample eligibility

✓ 2. Define Sample Lot and Lot Catalog

◆ Sample Lot (Sample_Lot_vod__c):

A **Sample Lot** represents a **batch** of a product with a specific **lot number** and **expiration date**.

Key Fields:

- Lot_Number_vod__c
- Product_vod__c (Lookup)
- Expiry_Date_vod__c
- Sample_Type_vod__c (Controlled, Non-Controlled)
- Status_vod__c (Active, Expired, etc.)

Example:

Lot #A1234 of "PainRelief" drug, expires on Dec 31, 2025.

◆ Sample Lot Catalog (Sample_Lot_Catalog_vod__c):

Controls **which sample lots** are available for **which user and geography**.

Key Fields:

- Sample_Lot_vod__c (Lookup)
- Territory_vod__c OR User_vod__c
- Start_Date_vod__c, End_Date_vod__c

Purpose: Limit users from distributing **expired or unauthorized** lots.

✓ 3. Explain Various Sample Transactions

Veeva records each sample-related activity as a **Sample Transaction**.

◆ Types of Sample Transactions (Sample_Transaction_vod__c):

Transaction Type	Description
Disbursement	Giving samples to HCPs during a Call
Inventory	Recording physical inventory count (monthly/quarterly)
Transfer	Moving samples from one rep to another
Adjustment	Manual corrections for lost/damaged items
Return	Returning samples back to the warehouse or corporate

Each transaction has:

- Quantity
- Date
- User
- Sample Lot
- Location
- Type

Example: Rep gives 2 units of Lot#A123 to Dr. Smith — recorded as a **Disbursement**.

✓ 4. Describe My Samples Tab

◆ What is “My Samples”?

The **My Samples** tab is a **user-facing interface** in Veeva CRM (iRep/iPad and Online) where reps can:

- **View current inventory**
- **Add samples to a call**
- **Track disbursement history**
- **Check expiration dates**
- **See inventory balances by lot/product**

◆ Features:

- Auto-hide expired/invalid lots
- Visual cue for low inventory
- Filter by product category

- "Add Sample" button for call pages

Use Case: Before a call, the rep checks My Samples tab to verify if they can give 3 samples of PainRelief.

✓ 5. Describe Sample Limits

◆ What are Sample Limits?

Sample Limits are **compliance controls** to restrict:

- How many samples a rep can carry or disburse
- How many samples an HCP can receive
- How often an HCP can receive a specific product

◆ Two Types of Limits:

Limit Type	Description
Rep Limits	Max inventory/disbursement limit for a rep (e.g., 100 units per month)
HCP Limits	Max quantity an HCP can receive (e.g., 6 units every 30 days)

◆ Enforced via:

- `Sample_Limit_vod__c` object
- Territory/Region-specific rules
- Regulatory rules per product/state

Example: Dr. Smith is limited to receiving 10 samples of Product X every 30 days. Veeva will block the call sample disbursement if the rep exceeds this.

✓ Summary (with Real-World Scenario)

Imagine a **pharmaceutical sales rep** working for a company like Pfizer:

1. They receive a shipment of **Sample Lot A123** for **Lipitor**.
2. The lot is defined in `Sample_Lot_vod__c` and assigned to their region via `Sample_Lot_Catalog_vod__c`.
3. They visit **Dr. Allen**, and from the **My Samples tab**, they select 2 units of Lipitor and log it as a **Disbursement** in the Call.
4. Veeva checks that Dr. Allen has a valid **state license**, the rep has not exceeded their **rep limit**, and the doctor hasn't received more than the **HCP limit**.
5. The transaction is stored in `Sample_Transaction_vod__c`, and inventory is automatically updated.

Would you like diagrams or sample metadata configuration for objects like `Sample_Lot_vod__c`, `Sample_Transaction_vod__c`, or field-level validations for compliance?

Define What is iRep

. Install iRep

Navigate through iRep UI

Configure iRep

. Define & Configure iRep CLM

Here's a detailed explanation of **iRep** and its configuration, installation, and navigation process within the **Veeva CRM ecosystem**, including **CLM (Closed Loop Marketing)**.

✓ What is iRep?

iRep is Veeva CRM's **iPad application** designed for **field sales reps** (typically in life sciences/pharma) to:

- Access customer data offline
- Capture HCP interactions (calls, samples)
- Present CLM (Closed Loop Marketing) content
- Synchronize data when online
- Ensure compliance with regulated activities

♦ **iRep = Veeva CRM + CLM on iPad**

♦ Real-World Scenario:

A medical rep visits a doctor in a clinic with no internet access. Using iRep, they:

- Access the doctor's profile
- Present a product brochure via CLM
- Log sample distribution and call notes
- Sync the data later from home or office

✓ How to Install iRep

♦ Requirements:

- iPadOS (compatible version as per Veeva release notes)
- Access to the **Apple App Store** or **MDM (Mobile Device Management)** deployment system
- Valid **Veeva CRM user credentials** with **iRep license**

◆ Installation Steps:

1. Open the **App Store** on the iPad.
2. Search for "**Veeva CRM**".
3. Tap **Download/Install**.
4. Open the app and **login** using your Veeva credentials.
5. Wait for the initial **data sync** (can take several minutes).

 Note: iRep must be **enabled** and **configured** for your user profile by your Veeva admin in Salesforce.

✓ Navigate through iRep UI

◆ Main Areas of iRep UI:

Section	Purpose
Home Screen	Custom tiles/widgets like My Accounts, My Schedule, My Samples
Navigation Bar	Quick access to tabs: Accounts, Calendar, CLM, Samples
My Accounts	View & search HCPs, clinics, and organizations
Calendar	Plan and view upcoming visits
Call Reporting	Log call notes, products discussed, samples given
CLM (Media Viewer)	Present approved promotional content
Sync Button	Upload/download data to/from Veeva servers

◆ Example:

A rep taps **My Accounts**, selects Dr. Smith, taps **Schedule a Call**, then opens **CLM** to show an interactive product presentation.

✓ Configure iRep

Configuration is done by Veeva Admins via Salesforce backend.

◆ Key Configuration Areas:

Area	Method
Enable iRep Access	Assign iRep_vod permission set
Control Tabs/Features	Use Veeva Settings in Veeva_Settings_vod__c
Offline Data Sets	Configure Sync_Configuration_vod__c
Media Configurations	Use Multichannel_Presentation_vod__c and related objects
Approved Emails, CLM	Assign product & media access via user profiles
User Territories	Configure which accounts each rep sees

◆ Example Config Setting:

```
plaintext
```

```
Setting Name: Enable_Samples_vod
Value: TRUE
```

Enables the **Samples** tab in iRep.

✓ Define & Configure iRep CLM (Closed Loop Marketing)

◆ What is CLM?

Closed Loop Marketing in iRep allows reps to present **approved content (PPT, PDFs, HTML, videos)** to HCPs and automatically capture:

- What slides were shown
- How long each slide was viewed
- Feedback or interests

This data is synced and used by marketing teams to refine content strategy.

◆ CLM Architecture:

Object	Purpose
Multichannel_Presentation_vod__c	Represents the presentation
Key_Message_vod__c	Each slide/content page
CLM_Presentation_vod__c	Tracks usage per call/user
Call2_vod__c	Call record where CLM was used

◆ CLM Configuration Steps:

1. **Upload Content** to Veeva Vault or CRM Media Library.
2. Create a **Multichannel_Presentation_vod__c** record.
3. Link individual slides or media as **Key_Message_vod__c**.
4. Set content access by:
 - Product
 - Territory
 - User Profile
5. In iRep, the CLM button will show available content for a rep to present.

◆ Example Use Case:

1. Rep opens Dr. Patel's profile in iRep.
2. Clicks on **Schedule a Call** → **CLM**.
3. Launches a **Multichannel Presentation** titled *"New Asthma Drug X"*.
4. Shows 5 slides — Veeva logs time spent on each.
5. After call, the CLM interaction is logged and synced to Salesforce.

✓ Summary Table

Feature	Description
iRep	iPad app for reps to interact with HCPs, manage calls, samples, and CLM content
Installation	App Store or MDM, Veeva credentials required
Navigation	Home, Accounts, Calendar, Samples, CLM
Configuration	Via Salesforce: Permission sets, Veeva Settings, Sync Config
CLM	Interactive presentations with analytics, configured via Media Library and Multichannel_Presentation_vod__c

Would you like a **step-by-step diagram**, **video guide**, or **admin-level configuration workbook** for any of these?

Define the Online & iPad DCR Process

Configure a DCR

. Look at the output/results of a DCR

Describe a DCR Model

. Describe the Network settings required for a DCR

Here's a comprehensive breakdown of the **DCR (Data Change Request)** process in **Veeva CRM**, both **online (Salesforce web)** and **offline (iRep on iPad)**, including configuration, model, outputs, and integration with **Veeva Network**.

✓ What is a DCR (Data Change Request)?

A **DCR** is a process that allows **field users** (such as sales reps) to **propose changes** to account-related data (e.g., address, specialty, name correction, etc.) which require **approval** before updating the master record.

↺ 1. Online & iPad DCR Process

◆ Online DCR Process (Salesforce Web UI):

1. User views an account (e.g., Dr. John Doe).
2. Clicks on **"Request Data Change"**.
3. A form opens to edit fields (e.g., change address or add specialty).
4. Submits the DCR.
5. The request is routed for **approval** (via internal Salesforce approval flow or Veeva Network).
6. Once approved, the changes are applied to the Account record.

◆ iPad DCR Process (iRep):

1. User opens **My Accounts** tab.
2. Selects an Account → taps **More Actions** → **Request Data Change**.
3. Edits fields as needed.
4. Taps **Submit**.
5. The DCR is saved locally and sent to Veeva CRM backend upon sync.
6. The approval flow processes the DCR via **Veeva Network** or internally.

2. Configure a DCR

DCRs are configured by admins in **Salesforce (Veeva CRM)**. Here's how:

✓ Required Objects:

- **Data_Change_Request_vod__c** – Main object that stores DCRs
- **Data_Change_Request_Line_vod__c** – Stores each field change
- **Field_Mapping_vod__c** – Maps editable fields to allow DCRs
- **Account** – DCRs are initiated from here

Configuration Steps:

Step	Description
1. Enable DCRs	Set ENABLE_DCR_vod in Veeva_Settings_vod__c to TRUE
2. Configure Field Mapping	Create records in Field_Mapping_vod__c for fields to be editable via DCR
3. Assign permissions	Ensure users have access to objects: Data_Change_Request_vod__c and related fields
4. Optional: Route to Veeva Network	Use Account_Sync_Status_vod__c , Record_Type_vod__c to indicate DCR flow to Network
5. Add DCR button	Add "Request Data Change" to Account page layout

3. Look at the Output/Results of a DCR

Once a DCR is submitted:

◆ In Salesforce:

- The record is saved in the **Data_Change_Request_vod__c** object
- Each changed field is logged in **Data_Change_Request_Line_vod__c**
- Status updates: *Draft* → *Submitted* → *Approved/Rejected*

◆ After Approval:

- Approved values are updated on the **Account** record
- Status changes to **Approved**
- User may receive notifications based on configuration

4. Describe a DCR Model

◆ DCR Data Model:

```

text

Account
  ↑
  |
Data_Change_Request_vod__c
  ↓
Data_Change_Request_Line_vod__c
  
```

📌 Key Fields in Data_Change_Request_vod__c:

- **Account_vod__c** – Related account
- **Status_vod__c** – Workflow status
- **Submitter_vod__c** – User submitting the DCR
- **Network_Request_vod__c** – Indicates if request is routed to Veeva Network

📌 Key Fields in Data_Change_Request_Line_vod__c:

- **Field_Name_vod__c**
- **Old_Value_vod__c**
- **New_Value_vod__c**
- **Change_Type_vod__c** – Add/Update/Delete

5. Network Settings Required for DCR

If your org integrates with **Veeva Network** (a master data management system for HCPs/HCOs):

✓ Required Network Configuration:

Setting	Description
Network_Integration_Mode_vod	Set to Enabled in Veeva_Settings
Account_Sync_Status_vod__c	Set to Pending_Verification_vod on new accounts
DCR_Route_to_Network_vod__c	Boolean field to determine if request should go to Network
Network_Target_Field_vod__c	Populated in Field_Mapping to indicate mapping to Network field
Country_vod__c	Used to route DCRs to the correct country rules

DCRs sent to Network can be reviewed by **data stewards** before they are returned and synced back into CRM.

✓ Summary Table

Component	Description
DCR	Data Change Request – used by reps to propose data changes
Online Flow	Request → Approve → Update
iRep Flow	Request via iPad → Sync → Approve
Main Objects	Data_Change_Request_vod__c, Data_Change_Request_Line_vod__c
Configuration	Field Mapping, Permissions, Page Layouts
Network Integration	Routes DCRs to Veeva Network for review and approval

Would you like a **diagram of the DCR data model**, **JSON sample of a DCR**, or a **step-by-step walkthrough for admin configuration** in Salesforce?

Define VEEVA Data Model - Account Visibility/Territory Alignment & Territory Hierarchy

Create Territories

Define VEEVA's Account Territory Loader (ATL)

List out ATL Best Practice

Describe Zip-to-Terr & Brick-to-Terr

Work with Territory Fields - Product Alignment by Territory and Accou

Here is a detailed breakdown of all the concepts related to **Veeva CRM Data Model**, specifically focusing on **Account Visibility**, **Territory Alignment**, **ATL**, and **Territory Fields**:

1. VEEVA Data Model – Account Visibility / Territory Alignment / Territory Hierarchy

✓ a. Account Visibility:

In Veeva CRM, **users can only view and interact** with Accounts that are assigned to them through **territories**.

Concept	Description
Territory	A group of accounts assigned to a user or team based on geographic, specialty, or business rules.
Account Territory Assignments (ATA)	Junction object (Account_Territory_Assignment_vod__c) that links Accounts to Territories.
Territory Fields	Used to define additional attributes or alignment values per Account-Territory pair.

✓ b. Territory Alignment:

Determines **which users can see or edit which accounts** based on the territories they are aligned to.

- Users are linked to territories using **User_Territory_vod__c**
- Accounts are aligned to territories via **Account_Territory_Assignment_vod__c**

plaintext

User ← User_Territory_vod__c → Territory_vod__c ← Account_Territory_Assignment_vod__c → Account

✓ c. Territory Hierarchy:

Territories are organized in a **hierarchical tree** (e.g., Region → District → Territory).

Level	Example
Region	West Zone
District	California North
Territory	San Francisco

This hierarchy helps in **manager views**, **roll-up reporting**, and **multi-level data access**.

2. Create Territories

You can create Territories manually or via Data Load:

◆ Manual Setup:

1. Go to **Territory_vod__c** tab.
2. Click **New**.

3. Define fields:

- Name
- Parent Territory (optional)
- Region/District
- Type (Primary/Secondary)
- Product Alignment Type

♦ Via Data Loader:

Prepare a CSV file with:

```
CSV

Name,Parent_Territory_vod__c,Region_vod__c,Type_vod__c
Territory A,Region A,West,Primary
```

And upload it using Salesforce Data Loader or Workbench.

3. Veeva's Account Territory Loader (ATL)

ATL is a Veeva-provided process to **bulk assign or remove accounts from territories** using a pre-defined data file.

Component	Description
Purpose	Mass assignment of Accounts to Territories
Tool	ATL loader via Vault/Workbench
Objects Impacted	Account_Territory_Assignment_vod__c
Supports	Zip/Brick logic, Product alignment, Territory fields

4. ATL Best Practices

Best Practice	Description
♦ Use Templates	Always start with the Veeva ATL CSV template.
♦ Validate Territory IDs	Ensure Territory_vod__c values are valid and active.
♦ Include All Required Fields	Fields like Account_vod__c , Territory_vod__c , and Primary_vod__c must be populated.
♦ Avoid Overlaps	Prevent multiple territories claiming the same account unless intentional (co-promotion).
♦ Back Up Before Load	Always export current ATA records before changes.
♦ Use "Upsert" Carefully	Avoid accidental duplication.
♦ Include Product Alignment Fields	Especially if doing product-specific assignments.

5. Describe Zip-to-Territory and Brick-to-Territory

✓ a. Zip-to-Terr:

A mapping of **ZIP Codes** to **Territories**.

Purpose	Assign accounts based on their ZIP Code automatically.
Object Used	ZIP_to_Territory_vod__c
Use Case	New HCPs or clinics added with a ZIP automatically fall into aligned territory.

✓ b. Brick-to-Terr:

A mapping of **Bricks** (sales divisions or micro-geographies) to **Territories**.

Purpose	Same as ZIP, but uses custom regions ("bricks") instead of ZIP codes.
Object Used	Brick_to_Territory_vod__c
Use Case	Pharma orgs using brick segmentation for reps.

6. Work with Territory Fields – Product Alignment by Territory and Account

Veeva allows **Product Alignment** at the **Account-Territory level**. This means:

- A rep may only be allowed to **detail** (promote) specific products to specific accounts in their territory.
- Restrictions apply based on **territory-product combinations**.

✓ Key Object: Territory_vod__c

✓ Key Field: Product_vod__c

This supports:

- **Targeting**: Only show relevant accounts for Product X in reports.
- **Compliance**: Prevent off-label promotion or detailing.

Example Scenario

Scenario: A pharma company has 3 reps. Each is responsible for a different product in different regions. You want to ensure only appropriate HCPs are aligned to them.

1. Create 3 territories: **North_ProductA**, **South_ProductB**, **West_ProductC**.
2. Use ATL to assign accounts to territories.
3. Use **Product_vod__c** to align each territory with the correct product.

4. Add ZIP-to-Terr mapping to automate alignment for new accounts.
5. Configure My Accounts view to reflect account-product-territory rules.

✓ Summary Table

Concept	Purpose
Account Visibility	Controlled by Account-Territory Assignment
Territory Hierarchy	Multi-level organizational structuring
ATL	Mass update Account-Territory relationships
Zip-to-Terr / Brick-to-Terr	Auto-assign new accounts based on geography
Product Alignment	Ensure reps promote the right product to the right HCPs

Would you like visual diagrams for the **territory data model**, **sample ATL template**, or help with **loading ATL files**?

Build reports and dashboards so that you could monitor and analyze your business data

I

Explain the difference between a Report, Dashboard and Report Type

Identify the limitations of VEEVA Reports and Dashboards

Here's a detailed explanation to help you understand **Reports**, **Dashboards**, and **Report Types** in **Veeva CRM** (which is built on top of Salesforce), as well as how to **build them** and what their **limitations** are:

1. Build Reports and Dashboards in Veeva CRM

Veeva CRM uses **Salesforce's reporting engine**, which means you can:

- **Track business KPIs**
- **Monitor rep performance**
- **Analyze HCP engagement**
- **Visualize sales, activity, and compliance data**

✓ Real-World Use Case:

A pharmaceutical company wants to track how many calls each medical rep makes per week, per product, and how many samples are distributed. Reports and dashboards can visualize this.

2. Difference Between Report, Dashboard, and Report Type

Feature	Report	Dashboard	Report Type
Definition	A table/chart showing data from one or more objects.	A visual display of multiple reports (charts, graphs).	The data model or relationship between objects used in a report.
Purpose	Query, summarize, and filter business data.	Visualize key metrics and KPIs.	Determine which fields and object relationships are available in reports.
Example	"All Calls made by Rep X this month"	Pie chart of Calls by Product + Bar chart of Top 5 HCPs contacted	"Calls with Accounts", "Accounts with Products", "Samples with Territories"

3. How to Build a Report in Veeva CRM

Step-by-Step:

1. Go to **Reports tab**.
2. Click **New Report**.
3. Choose a **Report Type** (e.g., Accounts with Calls).
4. Use **Filters** to narrow down (e.g., Date = Last 30 Days).
5. Add **Groupings** (e.g., by Rep, Product).
6. Add **Fields/Columns** (e.g., Account Name, Call Date, Product).
7. Save & Run the report.

4. How to Build a Dashboard

1. Go to **Dashboards tab**.
2. Click **New Dashboard**.
3. Choose a layout (Grid).
4. For each chart/widget:
 - Add a report
 - Choose a chart type (Bar, Line, Pie, Gauge)
 - Customize chart title, summary value
5. Save the dashboard.
6. Share with users/roles.

 Example: A dashboard showing:

- Bar chart: Calls by Rep
- Pie chart: Samples distributed by Product
- Line chart: Monthly HCP interactions

! 5. Limitations of Veeva Reports and Dashboards

Area	Limitation
Real-time Sync	Veeva syncs with Salesforce; on mobile (iRep), some dashboards may be delayed/offline.
Complex Joins	Can't report on more than 2-3 related objects unless a custom Report Type is created.
Cross-Object Filtering	Limited ability to filter across complex object hierarchies (e.g., HCP > Calls > Samples > Product > Region).
Customization on iPad (iRep)	Dashboards may not be as dynamic or flexible on iRep compared to browser-based UI.
No Native Predictive Analytics	Standard dashboards don't support machine learning or trend forecasting natively.
Data Volume Limits	Reports might not perform well with extremely large datasets unless summarized properly.
No Drill-Through from Dashboard	You can click through to a report, but not directly to the underlying records from a chart segment.

✓ Best Practices for Using Reports & Dashboards in Veeva CRM

Best Practice	Why
Use custom report types	Allows more flexibility and access to needed fields.
Schedule reports	Email weekly reports to managers and reps.
Leverage field filters	Narrow reports down to reps, territories, or time periods.
Include KPIs on dashboards	Shows performance goals vs actuals.
Use row-level formulas	To calculate call rates, % compliance, etc.
Optimize filters	To improve report performance and load time.

📌 Summary

Term	Quick Description
Report	A table or chart showing business data based on filters and groupings
Dashboard	A collection of reports visualized as widgets for monitoring KPIs
Report Type	Blueprint that defines the available fields and objects in a report
Limitation	Limited cross-object relationships, real-time sync on iPad, and lack of predictive analytics

Would you like me to **build a sample report layout** (like "Calls per Product per Rep") or show a **sample dashboard wireframe**?

Configure & Share a Coaching Report

- Explain User access for Reports
- Explain Life Cycle of Coaching report
- Create Coaching report

Here is a **detailed explanation** of how to **configure, create, and share a Coaching Report** in **Veeva CRM**, including the **user access setup** and **life cycle** of such reports.

What is a Coaching Report in Veeva CRM?

A **Coaching Report** is a structured record used by field managers or trainers to evaluate and provide feedback to field reps (users) on activities like **sales calls**, **CLM presentations**, **sample management**, or **compliance behavior**. It is part of **performance management** and **compliance training** within life sciences companies.

1. Configure a Coaching Report

To configure a Coaching Report, you usually create a **custom object** in Veeva CRM (on Salesforce) with relevant fields and logic.

Steps:

1. Create a Custom Object:

- Label: **Coaching Report**
- API Name: **Coaching_Report__c**
- Enable: **Track Field History, Reports, Activities**

2. Create Custom Fields:

- **Coaching Type** (Picklist: Field Ride, Call Review, Training)
- **Date of Coaching** (Date)
- **Coached Rep** (Lookup to User or Account)
- **Manager Feedback** (Long Text Area)
- **Rating** (Picklist: 1–5 or Meets/Exceeds/Below)
- **Next Steps** (Text Area)

3. Page Layouts & Record Types:

- Customize based on different types of coaching (e.g., Field Coaching vs. CLM Coaching).
- Show/hide fields based on record type.

4. Validation Rules & Workflows (Optional):

- Ensure required fields are completed before submission.
- Automatically send email on submission.

5. Create Report Type:

- Custom Report Type: "Coaching Reports with Users"

2. User Access for Coaching Reports

Access is controlled via:

Area	Configuration
Object-level Permissions	Grant Read, Create, Edit (and optionally Delete) access on Coaching_Report__c via Profiles or Permission Sets.
Field-level Security	Ensure users can see/edit fields like Rating, Feedback .
Record-level Sharing	Use Org-Wide Defaults (OWD), Role Hierarchy, or Sharing Rules to allow managers to see reps' reports.
Page Layout Assignment	Show different layouts for reps vs managers.

Real Example:

Managers can create and review coaching reports. Reps can view their feedback but not edit it after submission.

3. Life Cycle of a Coaching Report

The typical **life cycle** of a coaching report in Veeva CRM looks like this:

Stage	Description
1. Draft	Manager starts filling in coaching notes during/after field activity.
2. Review	Additional input, validation rules ensure all fields are filled.
3. Submit	Report is submitted — status changes to 'Submitted'.
4. Acknowledgement (Optional)	Rep receives notification and may acknowledge the feedback.
5. Follow-up	Manager/rep discuss next steps; report can be updated.
6. Lock or Archive	Final version is locked (optional). Used for audits or reviews.

 Tip: Add a **Status** picklist with values: **Draft, Submitted, Acknowledged, Closed**.

4. Create a Coaching Report

Step-by-Step (End-user perspective):

1. **Navigate to Coaching Reports Tab** (custom object).
2. Click **"New Coaching Report"**.
3. Fill in:

- Coached Rep (Lookup)
- Date of Coaching
- Coaching Type
- Feedback, Rating, Next Steps

4. Click **Save** or **Submit**.

5. (Optional) The report triggers an email to the rep.

6. Rep logs in, views the coaching feedback.

5. Share a Coaching Report

You can share a coaching report using:

Method	How
Email	Use a workflow rule or manual "Send Email" button to send a PDF or link to the coaching report.
Sharing Rules	Automatically share reports with users in a certain role or territory.
Manual Sharing	Use "Sharing" button (if enabled) to share with specific users.
Reports & Dashboards	Managers can view coaching summaries by team in dashboards.

Best Practices

Best Practice	Why
Use record types to customize coaching flows	Different feedback for CLM, Calls, Compliance
Make Coaching Report mobile-friendly (iRep)	Managers use iPads during field visits
Track status and history	For compliance and auditing
Use reports and dashboards	To monitor coaching completion and performance trends
Schedule monthly or quarterly coaching reviews	For consistent feedback and growth

Summary

Feature	Description
Coaching Report	A structured feedback record for evaluating reps
Configuration	Custom object + fields + layouts
User Access	Controlled via profiles, sharing, and page layouts
Life Cycle	Draft → Submit → Acknowledge → Closed
Sharing	Via email, manual sharing, or dashboards

Would you like a **sample layout** for the Coaching Report object or a **custom report** to track all coaching activities by manager?

- Describe Medical Inquiries life cycle
- Define the components of Medical Inquiry
- Configure various components of Medical Inquiry module I
- Configure Medical Inquiry module for multiple Product inquiries

Here's a comprehensive explanation of the **Medical Inquiries** lifecycle and how to configure the **Medical Inquiry module in Veeva CRM**, including its components and configuration for multiple product inquiries:

✓ What is a Medical Inquiry in Veeva CRM?

A **Medical Inquiry** is a structured process in which healthcare professionals (HCPs) request detailed, often scientific or regulatory, information about a company's product (e.g., drug, vaccine, device). These inquiries must be tracked, fulfilled, and logged for compliance with regulatory bodies like FDA or EMA.

↻ Medical Inquiries Lifecycle

The **life cycle** of a Medical Inquiry includes the following stages:

Stage	Description
1. Creation	Field rep or medical science liaison (MSL) creates a new medical inquiry record after HCP raises a question.
2. Capture Details	Enter HCP name, product in question, question type, delivery method, urgency, and due date.
3. Submission	Inquiry is submitted for review or fulfillment by the Medical Information (MI) team.
4. Fulfillment	MI team provides a standard response document or prepares a custom response.
5. Delivery	The response is delivered to the HCP (e.g., via email, mail, or personal visit).
6. Closure	Inquiry is marked as fulfilled/closed and becomes auditable.

✓ **Optional Steps:** Inquiry escalation, linking to Adverse Events (AE) or Product Complaints (PC), generating fulfillment letters.

🧱 Components of Medical Inquiry

A typical **Medical Inquiry Module** in Veeva consists of these components (objects):

Component	Description
Medical Inquiry (MI)	The core object capturing HCP questions about a product.
Fulfillment	Linked object where the actual response or material is documented.

Component	Description
Inquiry Product	Junction object that allows multiple products per inquiry.
Contact (HCP)	The person who raised the inquiry.
Call	The related call activity, if the inquiry was captured during a rep visit.
Medical Inquiry Templates	Pre-approved response templates for standard questions.
Attachments	Documents delivered to the HCP.
Status	Indicates the stage (New, Submitted, Fulfilled, Closed, Cancelled).

Configure Various Components of the Medical Inquiry Module

1. Medical Inquiry Object Setup

- Enable Medical Inquiry object in **Veeva CRM** (if not already present).
- Fields to include:
 - Inquiry Type
 - Priority
 - Inquiry Description
 - Due Date
 - Contact (HCP Lookup)
 - Territory/User
 - Status
 - Delivery Method
 - Fulfilled Date

2. Create Page Layouts

- Different layouts for:
 - Field Reps (data entry only)
 - Medical Affairs team (fulfillment access)
- Add related lists: Inquiry Products, Fulfillment Records

3. Validation Rules

- Ensure critical fields (HCP, Product, Due Date) are mandatory before submission.
- Lock records after closure.

4. Workflow/Process Builder

- Send alerts when a new inquiry is created.
- Auto-update status on fulfillment.
- Escalate overdue inquiries.

5. Medical Inquiry Templates

- Store pre-approved response documents (PDFs) linked to specific products and questions.
- Selectable during the Fulfillment process.

Configure for Multiple Product Inquiries

A single medical inquiry may cover **more than one product** (common in combination therapy). Use the **Inquiry Product** junction object.

Setup:

1. Create “Inquiry Product” Object

- Lookup to Medical Inquiry
- Lookup to Product
- Optional: Inquiry Topic/Subtopic per product

2. Page Layout Configuration

- Add a related list for Inquiry Products on Medical Inquiry layout.
- Use **Add Row** functionality (iRep-enabled) to allow reps to enter multiple products in one inquiry.

3. Fulfillment Mapping

- Configure fulfillment logic to deliver tailored content for **each product**.
- Enable field validation to ensure fulfillment is done for all associated products.

Example Scenario: Multiple Product Inquiry

Scenario:

A cardiologist asks a rep:

“Can I use **Drug A** with **Drug B** in diabetic patients? What’s the interaction risk?”

Flow:

1. Rep opens **Medical Inquiry** record.
2. Adds **Dr. Smith** as the HCP.
3. Enters the inquiry description.
4. Adds two rows in **Inquiry Products**:
 - Row 1: Drug A
 - Row 2: Drug B
5. Submits the record.
6. Medical Affairs team responds with two fulfillment documents (one per drug) and logs them.

7. Mark the inquiry as Fulfilled.

✓ Best Practices

Practice	Reason
Use standard templates where possible	Ensures compliance and faster fulfillment
Log fulfillment method	Email, printed copy, personal delivery—important for audits
Link to AE/PC if needed	Regulatory requirement if inquiry leads to reporting
Use due dates and SLAs	Ensure timely responses to HCPs
Lock records post-fulfillment	Prevents tampering with audit trail

📌 Summary Table

Item	Description
Medical Inquiry	Tracks HCP questions on medical/scientific topics
Fulfillment	Documents the response provided
Multiple Products	Configured using Inquiry Product junction object
Lifecycle	Create → Submit → Fulfill → Deliver → Close
Key Objects	Medical Inquiry, Fulfillment, Contact, Inquiry Product
Platform	Veeva CRM on Salesforce (Web, iRep - iPad)

Would you like a **visual data model diagram**, **sample field list**, or **validation rule examples** for any part of this module?

Describe and Create survey life cycle cycle

Describe Survey Management Page

Describe Data Model

Here's a **complete explanation** of the **Survey Lifecycle**, the **Survey Management Page**, and the **Survey Data Model** in **Veeva CRM**, including creation steps, real-world use cases, and best practices.

✓ What is a Survey in Veeva CRM?

A **Survey** in Veeva CRM is a tool used to collect structured feedback or data from **Healthcare Professionals (HCPs)**. Surveys can be executed via iRep (iPad), Browser, or remote channels, and are commonly used for:

- Market research

- Feedback on product messaging
- Tracking key metrics like awareness, satisfaction, etc.
- Compliance programs

Survey Lifecycle in Veeva CRM

The **Survey lifecycle** defines how a survey is created, deployed, completed, and analyzed.

Survey Life Cycle Stages

Stage	Description
1. Design/Creation	Survey templates are created with questions and logic.
2. Approval	Survey goes through internal approvals (e.g., Medical, Legal).
3. Deployment	Survey is assigned to field reps or teams via targeting.
4. Execution	Field reps administer surveys during calls (iRep) or send via Approved Email.
5. Completion	HCP submits responses; data is saved to Veeva database.
6. Analysis	Reports and dashboards are used to review feedback and KPIs.

✓ You can control when the survey appears (start/end dates), audience (targeting), and frequency (one-time or repeat).

How to Create a Survey

Pre-requisites: Ensure you have the Survey object and permissions enabled in your org.

Steps:

1. **Navigate to the Survey Module** in Veeva.
2. Click on **"New Survey"**.
3. Fill in:
 - **Name:** E.g., "Q3 Product Awareness Survey"
 - **Status:** Draft
 - **Start/End Date**
 - **Target Product** (optional)
 - **Territory/Rep Assignments**
4. Add **Survey Sections** (optional)
5. Add **Survey Questions:**
 - Types: Text, Numeric, Picklist, Checkbox, Yes/No, Date, etc.
 - Define **Answer Choices**
 - Define **Required/Optional**

- Set **Logic/Branching** if needed
6. **Activate** the Survey once finalized.

Survey Management Page

The **Survey Management Page** is the interface where administrators or power users manage surveys.

Main Areas:

Area	Description
Survey List View	Shows all surveys with filter options by status, owner, product.
Survey Builder	Drag-and-drop interface to build and organize questions.
Targeting Panel	Assign surveys to users, roles, or territories.
Schedule Controls	Set availability windows (start/end date).
Logic Rules	Show/hide questions based on prior answers.
Response Summary	View how many responses are completed/in progress.
Data Export	Export results to Excel/CSV or integrate with analytics tools.

Survey Data Model

Here's an overview of the core **data model** behind Veeva Surveys:

Object	Description
Survey_vod	The master survey definition.
Survey_Target_vod	Links a survey to HCPs or Accounts; controls who can receive the survey.
Survey_Question_vod	Stores each individual question.
Survey_Response_vod	Captures user answers (linked to Survey Target).
Survey_Section_vod (optional)	Groups questions into sections (used for organization).
Call_vod (optional)	Ties the survey execution to a Veeva Call if done during a rep visit.
Product_vod	Links to the product the survey is about.

 One Survey can have multiple questions, and each HCP (target) can generate multiple responses.

Real-World Example: HCP Feedback Survey

Objective: Collect feedback from Cardiologists about a new heart medication.

1. Create Survey:

- Questions:
 - "Have you prescribed Product X?"
 - "Rate Product X's effectiveness (1–5)"

- "Would you like more scientific information?"
- Targeted to: All cardiologists in North America
- Delivery: In-person via iRep during rep visits

2. Deploy:

- Field reps see a "Survey" button in iRep
- During calls, reps administer the survey on iPad

3. Collect Responses:

- HCPs respond, data saved in **Survey_Response_vod**
- Linked to **Call2_vod** for auditing

4. Analyze:

- Use Salesforce dashboards or export to Power BI
- Identify areas where HCPs want more info or training

Best Practices

Practice	Reason
Keep surveys short and focused	Higher completion rates
Use branching logic	Makes the survey relevant to each HCP
Monitor response trends weekly	Catch issues or low engagement early
Include a "Comments" field	Gets valuable qualitative feedback
Deactivate expired surveys	Avoid clutter and confusion for reps

Would you like:

- A **visual ER diagram** of the Survey data model?
- A **custom sample survey template** to import?
- Examples of **Survey reporting dashboards**?

Let me know, and I'll include that next!

Describe a Medical Event and its features

Identify Event Attendees

Event Attendee Record Types

Configure Custom Buttons

I

- Add Attendee button
- Add My Attendance button
- Manage Attendees
- Capture and View Attendee signatures
- Edit and grant permissions in Sign-In Sheet
- Record Calls with Medical Events

Here's a **complete explanation** of the **Medical Event** module in Veeva CRM**, its features, attendee management, and configuration of related buttons and permissions — including real-world context and best practices.

✓ What is a Medical Event in Veeva CRM?

A **Medical Event** (also known as a **Speaker Event**, **Medical Education Event**, or **Scientific Meeting**) is a planned and tracked interaction involving **Health Care Professionals (HCPs)** for scientific or educational purposes.

These events are important for:

- **Scientific exchange**
- **Product awareness**
- **Compliance tracking**
- **Field medical/marketing activities**

★ Key Features of Medical Events

Feature	Description
Event Scheduling	Create & manage events across locations, time zones, and hosts.
Attendee Tracking	Capture details of HCPs attending the event.
Call Recording	Track and log follow-ups with attendees.
Compliance Management	Ensure sign-in sheets, limits, and rules are followed.
Signature Capture	Capture digital or physical signatures of attendees.
Custom Buttons	Easily add attendees or register own attendance.
Mobile Compatible	Accessible through iRep on iPad.

👤 Identify Event Attendees

Attendees can include:

- HCPs (Doctors, Specialists, etc.)
- Internal employees (Medical Science Liaisons, Reps)
- Non-HCPs (Admin staff, caregivers — if allowed)

Event Attendee Record Types

The **Event Attendee** object supports **record types** to distinguish between various types of participants.

Record Type	Usage
HCP	For licensed professionals attending the event
Rep	Internal employees attending the event
Other	Non-HCPs like support staff (optional, depending on org policy)

Each record type can have different page layouts, validations, and compliance rules.

Configure Custom Buttons

To simplify attendee actions, configure these buttons in the Medical Event layout:

Add Attendee Button

- Opens a pop-up or redirect to select an HCP and add them as an attendee.
- Automatically links the account to the event.

Best Practice: Pre-filter the attendee list by territory or specialty to avoid irrelevant data.

Add My Attendance Button

- Used by reps/MSLs to mark themselves as attending.
- Adds the current user to the Attendee list with the Rep record type.

Manage Attendees

In the Event record:

1. Go to the **Attendees related list**
2. View existing attendees
3. Add, edit, or remove participants
4. Record the **Status** (Invited, Confirmed, Attended, No Show, etc.)

Capture and View Attendee Signatures

This is critical for compliance.

How It Works:

- Use **iRep** to capture e-signatures during or after the event.
- Each signature is stored with the **Event_Attendee_vod** record.

Signature Types:

- Digital signature via iPad
- Uploaded scanned signature
- Checkbox to acknowledge attendance (if allowed)

Edit and Grant Permissions in Sign-In Sheet

The **Sign-In Sheet** is a Veeva-generated record that lists all attendees and collects their signatures.

Admin Permissions:

Task	Permission Required
Add/Remove attendees from sheet	CRUD on Event_Attendee_vod
Print or export sheet	View access on Medical_Event_vod
Allow signature capture	Field-level access to Signature_vod__c
Edit after event close	Requires override (optional config)

Tip: Always restrict editing after event close for compliance.

Record Calls with Medical Events

You can link **Call records** to event attendees.

Why record calls?

- Track follow-ups
- Capture post-event discussions
- Reinforce messaging and education

How:

1. Navigate to the Medical Event
2. Go to the **Event Attendee** related list
3. Click "**Record Call**" next to the HCP name
4. This opens the standard Call2_vod record tied to the Event

- The Call record links back to the Medical Event via **Medical_Event_vod__c** lookup.

Real-World Scenario: Oncology Speaker Program

- A Medical Affairs team plans an event titled “**Advances in Breast Cancer Treatment**”.
- They invite 30 Oncologists across 3 states.
- The Rep uses iRep to:
 - Add attendees via the **Add Attendee** button
 - Add their own attendance using **Add My Attendance**
 - Capture digital signatures at the event using an iPad
- Post-event, the Rep follows up with 10 attendees and logs calls.
- The Event Coordinator pulls reports on attendee participation and compliance using the Sign-In Sheet and Call data.

Best Practices

Practice	Reason
Always use record types to segment attendee roles	Clean data + accurate reporting
Enforce signature capture before marking attendance	Compliance & audit tracking
Restrict post-event edits unless authorized	Avoid tampering or errors
Use custom buttons to streamline Rep workflows	Better UX, fewer mistakes
Record follow-up calls for HCPs	Continuity and impact measurement

Would you like:

- A **Visual ERD** of the Medical Event module?
- A sample **Medical Event Flowchart**?
- Configuration steps for custom buttons in your org?

Let me know, and I'll guide you through it!
