

What is veeva give me overview and explain with examples

Veeva Systems is a leading **cloud-based software provider** focused on the global life sciences sector, including pharmaceutical, biotech, and medical device companies. Founded in 2007 in Pleasanton, California, by Peter Gassner and Matt Wallach, it delivers industry-specific SaaS solutions to help organizations streamline operations, manage regulated content, and ensure compliance from R&D through commercialization [Wikipedia+12](#) .

## What Is Veeva?

- **Industry cloud for life sciences:** Veeva's software platform is built to meet the strict regulatory, validation, and security needs of the life sciences industry [Veeva Systems](#).
- **Cloud-native SaaS:** Offered exclusively via the cloud, with applications for content management, CRM, regulatory information management (RIM), quality systems, training, and more [Wikipedia quality.veevavault.help](#).
- **Used by over 1,000 organizations,** including major pharma and biotech firms like Merck, Novartis, Bayer, Pfizer, Amgen, Gilead, and more [Veeva Systems+1](#) .

## Core Components and Use Cases

### 1. Vault Platform and Applications

The **Vault Platform** is Veeva's enterprise-grade content and data management backbone. It supports:

- Document versioning, e-signatures, audit trails, workflow automation, and metadata tagging.
- Fully validated release cycles (IQ/OQ) to help regulated companies reduce validation costs and meet compliance mandates [Veeva Systems+15](#) .

On top of it are specialized applications:

- **Veeva Quality** suite—including QualityDocs, QMS, product surveillance, and training—to manage global quality and compliance processes end-to-end [quality.veevavault.help+1](#) .
- **Veeva RIM (Regulatory Information Management):** Automates regulatory submissions, tracking deadlines and managing risk with audit-ready trails, templates, and collaboration tools [FME US, llc+15](#) .
- **eTMF (electronic Trial Master File):** Stores clinical trial documentation; relationships and cross-linking of metadata across multiple Vaults help clinical, medical, and regulatory teams stay in sync [clinical.veevavault.help+3](#) .

### 2. CRM Platforms

- **Veeva CRM** was built for life sciences field force—enabling multichannel engagement (in-person, email, web), compliance in interactions, and planning tools for reps  
[Assemble Studio+1](#)
- Starting in 2025, Veeva is transitioning from Salesforce-based CRM to its own **Vault CRM** platform, offering tighter integration, more control, and cost efficiency. The shift enables Veeva to unify content, data, and engagement tools on its own platform. Merck has committed to moving to Vault CRM in this changeover [Veeva Systems](#).

### 3. Veeva AI & Analytics

- Veeva supports AI-driven analytics embedded into its platform—such as CRM suggestion engines and automated compliance checks.
- AI agents in **Vault QualityDocs** can auto-index, tag metadata, check compliance, manage versions, and streamline search workflows—accelerating review cycles and boosting quality assurance efficiency [IntuitionLabsgetguru.com+1](#)

## Real-World Examples

### ✓ Example 1: Enhancing Field Productivity with Veeva CRM

A pharma company used Veeva CRM to build “views” that constantly track HCP license expirations across regions. As data changes, the view updates in real-time—ensuring field reps only engage with licensed professionals. For comparative purposes, they also created static “lists” (snapshots) of offices closed on certain days—helping plan rep schedules efficiently [cnxsi.com](#).

### ✓ Example 2: Improving Regulatory Workflow via RIM

An organization implementing **Veeva RIM** used workflows and audit tools to automate preparation and tracking of global submission packages. They monitored deadlines, used structured templates, and gained collaboration visibility across internal and external stakeholders—reducing risk and accelerating time-to-market [FME US, llc+14](#)

### ✓ Example 3: Automating Quality Document Management

Using **Veeva Vault QualityDocs** with AI agents, a company automated document indexing and metadata tagging for GxP documentation, replaced manual version checks, and implemented auto compliance audits. This turbo-charged review and approval cycles in their quality management system [getguru.com+4](#)

## Summary Table

| Category           | What It Is                                       | Example Use Case                                      |
|--------------------|--------------------------------------------------|-------------------------------------------------------|
| Vault Platform     | Validated content + data management backbone     | Single system for documents and structured data       |
| Vault Quality Apps | QMS, QualityDocs, surveillance, training modules | Automating quality reviews and batch record workflows |

| Category              | What It Is                                           | Example Use Case                                             |
|-----------------------|------------------------------------------------------|--------------------------------------------------------------|
| Veeva RIM             | Regulatory submission tracking and document workflow | Submissions to FDA/EMA with tracking and audit history       |
| Veeva CRM & Vault CRM | Life sciences-specific relationship & engagement CRM | Reps plan omnichannel outreach; Merck migrating to Vault CRM |
| Veeva AI              | Embedded AI agents and analytics                     | Auto-tag documents, CRM prompts, compliance validation       |

## Strategic and Industry Impact

- In recent months, Veeva has expanded in China—partnering with six of the top 20 biopharma companies to deploy localized CRM tools like China Events Management and approved WeChat engagement modules, driving strong revenue and growth momentum [Veeva Systems](#)  
[YouTube+2](#) [quality.veevavault.help](#)  
[Assemble Studio+4](#) [industries.veeva.com](#)  
[Investors+2](#) [getguru.com+1](#) [Investors.](#)
- The planned **split from Salesforce in September 2025** and full shift to Vault CRM reflects Veeva's commitment to independence and deeper integration capabilities; its high customer satisfaction and continued AI investments underline its leadership in life sciences SaaS  
[Investors+4](#) .

## TL;DR

Veeva Systems is a cloud-native platform tailored for highly regulated life sciences companies. They offer modular applications for content/data management, quality, regulatory and commercial workflows—all within a validated, secure environment. With AI-powered automation, they accelerate review cycles, reduce manual errors, and enable smarter engagement. Clients include top global pharma players, and a strategic shift in 2025 moves their CRM fully onto the Vault platform.

Let me know if you'd like a deeper dive into any product or real-world case example!

How is veeva related to Salesforce

Veeva Systems has a **historical and technical relationship** with Salesforce, but that relationship is changing. Here's a clear breakdown:

## Veeva & Salesforce: The Relationship

### 1. Built on Salesforce Platform (Initially)

- Veeva CRM**, the core customer relationship management product offered by Veeva for the life sciences industry, was originally **built on top of the Salesforce platform** using the Salesforce

**Force.com** architecture.

- This allowed Veeva to rapidly develop and deliver a cloud-based CRM tailored to pharmaceutical and biotech sales teams while leveraging Salesforce's secure infrastructure, scalability, and deployment model.

💡 Think of it like this:

Veeva built a specialized life sciences application on top of Salesforce's general-purpose CRM engine.

## ✅ 2. Veeva Was an Official Salesforce ISV Partner

- Veeva was a **Salesforce Independent Software Vendor (ISV) partner**, which allowed it to license Salesforce's technology and integrate deeply into the Salesforce ecosystem.
- As part of this partnership, Salesforce received **royalties from Veeva's CRM revenue**.

## ❌ The Transition: Veeva Ending Ties with Salesforce

### 🔄 3. Veeva Is Transitioning to Its Own Platform (Vault CRM)

- In **2022**, Veeva announced that it would **end its reliance on Salesforce** and migrate its CRM to its own **Vault platform**, creating **Vault CRM**.
- This **transition will be completed in September 2025**, after which **all new CRM customers will be on Vault CRM**, not Salesforce.

### 💡 Why?

- **Control**: Veeva wants full control over the technology stack and innovation roadmap.
- **Integration**: Vault CRM will be tightly integrated with other Veeva applications (like Vault Quality, RIM, and PromoMats).
- **Cost**: Avoid paying Salesforce licensing/royalty fees.
- **Speed & Customization**: Allows more specialized features for life sciences that Salesforce's platform may not prioritize.

### 🏢 Example: Merck Transitioning to Vault CRM

- **Merck**, one of Veeva's largest customers, announced it will **migrate from Veeva CRM (on Salesforce) to Vault CRM**, reinforcing Veeva's independence from Salesforce.

### 📊 Summary Comparison

| Feature        | Veeva CRM (Old)        | Vault CRM (New)      |
|----------------|------------------------|----------------------|
| Built On       | Salesforce (Force.com) | Veeva Vault platform |
| Partnered With | Salesforce             | Fully Veeva-owned    |

| Feature                     | Veeva CRM (Old)                | Vault CRM (New)           |
|-----------------------------|--------------------------------|---------------------------|
| Licensing Costs             | Royalties paid to Salesforce   | No external licensing     |
| Platform Control            | Shared with Salesforce roadmap | Fully controlled by Veeva |
| End-of-Life                 | Sept 2025                      | Continuously evolving     |
| Integration with Veeva Apps | Via APIs                       | Native & seamless         |

## TL;DR

- Veeva CRM was originally built on Salesforce's platform.
- Veeva used Salesforce's infrastructure to deliver tailored CRM tools for life sciences.
- Now, Veeva is transitioning to its **own Vault CRM**, ending its dependence on Salesforce by **2025**.
- This shift allows Veeva greater control, integration, and innovation flexibility.

Would you like a diagram to visualize this transition or an explanation of Vault CRM features?

Explain the real use of veeva in simple language with real life example or analogy

Sure! Let's break down **what Veeva really does** using **simple language** and a **real-life analogy**.

## What Is Veeva — In Simple Terms?

Veeva is like a **super-organized digital assistant** for pharmaceutical companies. It helps them **keep track of documents, data, and people**, all while following **strict rules** set by health authorities (like the FDA).

Pharma companies use Veeva to:

- Organize clinical trial documents 📁
- Make sure their medicines are approved properly ✅
- Manage sales reps who talk to doctors 👨👩
- Train employees and track who did what 🧑🏫
- Store all information safely and in one place 🔒

## Real-Life Analogy: Movie Production Studio 🎬

Imagine a **movie studio** making a blockbuster film. There are:

- **Writers** creating scripts
- **Directors** planning scenes
- **Actors** performing

- **Lawyers** handling legal stuff
- **Marketers** promoting the film

They need a **central platform** to:

- Store and manage scripts, contracts, and footage
- Track who approved which scene or ad
- Ensure legal compliance with copyright rules
- Schedule everyone and keep them in sync

🧑 Without this, it's chaos.

---

## ✅ Now Replace the Movie Studio with a Pharma Company:

- **Scripts = Drug development documents**
- **Actors = Scientists, doctors, marketers**
- **Lawyers = Regulatory teams ensuring FDA rules are followed**
- **Studio = Pharma company**
- **Central platform = Veeva**

Just like the studio uses a platform to manage production, a pharma company uses **Veeva** to manage everything from:

- Researching the drug 🧪
- Getting approval from authorities ✅
- Training staff 🧑
- Selling it to doctors 💊

All in one clean, traceable, compliant system.

---

## 💡 Real Use Example (Simplified):

Let's say Pfizer is launching a new vaccine.

1. They need to **track all trial documents**—results, approvals, lab reports.
2. Then, they need to **submit documents to the FDA** for approval.
3. Their **sales team** needs to be trained and follow rules on what they say to doctors.
4. They want to **store and share promotional content** legally (e.g., brochures, videos).

👉 **Veeva helps them do all this in one platform**, securely, efficiently, and following all the strict rules of medicine.

## Simple Summary

**Veeva is like a digital control room for pharmaceutical companies**—keeping everything organized, tracked, and compliant from drug discovery to sales.

Let me know if you'd like a visual or animation-style explanation too!

How medical rep is related to veeva

Great question! Let's explain the connection between **Medical Representatives (Med Reps)** and **Veeva** in **simple terms**.

## Who Is a Medical Representative?

A **Medical Representative (Med Rep)** is someone who:

- Works for a **pharmaceutical or biotech company**
- Visits **doctors, hospitals, or clinics**
- **Promotes and explains medicines**
- Collects feedback and **tracks doctor interactions**
- Ensures the company's products are being properly used

## How Is a Med Rep Related to Veeva?

**Veeva CRM** is a **digital tool** that Medical Reps use **daily** to:

| Task                     | Without Veeva              | With Veeva CRM                          |
|--------------------------|----------------------------|-----------------------------------------|
| Plan doctor visits       | Manual notes, spreadsheets | Smart calendar with doctor profiles 📅   |
| Show medicine brochures  | Printed materials          | Digital, compliant content on tablet 📱  |
| Record meeting notes     | Paper or Excel files       | Direct entry into Veeva after meeting 📝 |
| Check doctor preferences | Memory or rough logs       | Veeva shows history, preferences 💡      |
| Track sales and samples  | Offline tracking           | Veeva logs it automatically 📦           |
| Ensure legal compliance  | Manual review              | Veeva shows approved content only ✅     |

## Real-Life Example:

Imagine you're a Med Rep visiting **Dr. Smith**.

### Without Veeva:

- You bring a paper brochure.

- You talk about a medicine but aren't sure if it's the latest info.
- You forget what Dr. Smith said last time.
- You write notes later in a spreadsheet.

 Risk of errors, outdated info, and non-compliance.

## With Veeva CRM:

- You open your tablet.
- You see Dr. Smith's past feedback and preferred contact method.
- You show an approved digital brochure.
- After the meeting, you record feedback right away.
- You log the number of samples left with the doctor.

 Everything is **organized, compliant, and efficient**.

## TL;DR

A **Medical Representative** uses **Veeva CRM** to plan visits, track interactions with doctors, manage medicine samples, and ensure legal compliance.

It's like giving Med Reps a **smart assistant** that makes their work faster, smarter, and 100% rule-following.

Would you like a demo workflow or a visual explaining a Med Rep's day with Veeva?

Irep and ipad

Great! Let's explain **iRep** and **iPad** in the context of **Veeva** and **Medical Representatives (Med Reps)**:

## What is iRep?

**iRep** is a **Veeva CRM app designed specifically for the iPad**.

It's a **mobile app** that Medical Representatives (Med Reps) use to:

- **Plan doctor visits**
- **Show digital presentations** (approved content)
- **Record meeting notes**
- **Track samples given to doctors**
- **Work offline** (and sync later)

It's fast, compliant, and optimized for **face-to-face interactions** in the field.

## Why iPad?

Veeva's iRep is designed **only for iPad** because:

- iPads are **lightweight, portable, and user-friendly** for Med Reps.
- iOS is **secure**, helping pharma companies meet compliance standards.
- iPad touch interface works great for **visual storytelling**—like showing animations, images, and videos of how a drug works.

## Real-Life Example: Med Rep Using iRep on iPad

Let's say you're a Med Rep visiting **Dr. Ramesh**.

**Here's how your day goes using iRep on iPad:**

1.  **Open iRep App**  
See all your scheduled doctor visits for the day.
2.  **Review Dr. Ramesh's Profile**  
Check past meetings, interests, and notes from your last visit.
3.  **Meet the Doctor**  
Use iPad to show a **beautiful, interactive presentation** of a new drug.
4.  **Follow Compliance**  
iRep only allows **approved content** to be shown—no risk of violations.
5.  **Log Meeting Notes**  
After the visit, you quickly type feedback and update sample details.
6.  **Sync Later**  
Even if there's no internet at the clinic, iRep works **offline** and syncs when you're back online.

## Benefits of iRep on iPad

| Feature                                                                                                  | How It Helps a Med Rep                      |
|----------------------------------------------------------------------------------------------------------|---------------------------------------------|
|  All-in-one App       | Replaces notebooks, brochures, reports      |
|  Doctor History       | Prepares you for personalized conversations |
|  Visual Presentations | Engaging, interactive drug details          |
|  Instant Note Logging | Saves time and reduces errors               |
|  Compliance Built-in  | No risk of showing unapproved content       |
|  Works Offline        | No need for constant internet connection    |

## TL;DR

**iRep** is a Veeva CRM app made for **iPad**, giving Medical Reps everything they need to manage doctor visits, show drug info, record notes, and stay compliant—**all in one powerful mobile tool**.

Would you like a sample iRep workflow or UI design to visualize this better?

How it works offline

Great question! Let's break down **how Veeva iRep works offline** on an iPad in a simple, real-world way.

## How Does Veeva iRep Work Offline?

**Veeva iRep** is designed to work **both online and offline**—which is crucial for Medical Reps who may visit hospitals, rural clinics, or buildings with no internet.

 **Think of it like a "smart suitcase":**

When you're **online**, iRep:

- **Downloads your data** to your iPad:
  - Doctor schedules
  - Previous meeting notes
  - Product brochures, videos, slides (approved content)
  - Forms for logging samples, orders, feedback

Then, when you're **offline**, you can:

- Access everything that was downloaded 
- Visit doctors and show content 
- Record new meeting notes, doctor feedback, and sample drops 
- Create reports, submit forms, and plan your next visits 

All this information is **stored locally on your iPad**.

## What Happens When You're Back Online?

When you reconnect to Wi-Fi or mobile data:

1. iRep **automatically syncs** with the Veeva server.
2. It **uploads** everything you did offline:
  - Meeting notes

- Sample drop records
- New doctor info
- Form submissions

3. It **downloads** any updates:

- New doctor appointments
- New marketing materials or compliance content
- Changes in product information

✓ This sync happens **securely and in the background**.

## Is Offline Mode Safe?

Yes. iRep uses:

- **Data encryption** on the device (iPad)
- **Secure login** and authentication
- **Audit tracking** to log who did what and when (even offline)

## Real-Life Analogy:

Imagine you're a food delivery driver. You:

- Download your **routes and orders** in the morning (online).
- Deliver food during the day (offline in areas with no signal).
- At night, reconnect and **sync updates** with HQ.

iRep works the same way—for **doctors instead of customers**, and **drug info instead of food**.

## TL;DR

Veeva iRep works offline by **storing data locally on your iPad** (like schedules, documents, doctor info).

You can work without internet, and once you're back online, it **automatically syncs** everything with Veeva's cloud.

Would you like a diagram showing the sync flow (offline → online)?

What other work veeva does

Veeva does **much more** than just support Medical Reps with CRM tools. It offers a **full suite of cloud-based applications** tailored for the **life sciences industry**—from **drug development to marketing**

and compliance.

Here's a clear breakdown:

## What Other Work Does Veeva Do?

### 1. Clinical Trials Management

Helps pharmaceutical companies **run and track clinical trials**.

- **Veeva Vault eTMF (Electronic Trial Master File):**
  - Stores trial documents (like consent forms, protocols)
  - Tracks approvals and timelines
- **Veeva CTMS (Clinical Trial Management System):**
  - Manages trial progress, sites, and investigators

✓ Used by clinical teams to stay audit-ready and organized during drug testing.

### 2. Document & Content Management

Handles **regulated documents** like drug labels, SOPs, brochures, and legal approvals.

- **Veeva Vault QualityDocs:** Stores and manages standard operating procedures (SOPs) for manufacturing and lab work.
- **Veeva Vault PromoMats:** Manages advertising and promotional content, ensuring it meets legal and regulatory rules.

✓ Ensures content is **version-controlled, audited, and FDA-compliant**.

### 3. Quality Management System (QMS)

Helps life sciences companies maintain **product quality and compliance**.

- **Veeva Vault QMS:**
  - Tracks issues like deviations, CAPAs (Corrective and Preventive Actions)
  - Supports audits, change control, and supplier quality

✓ Used by manufacturing and QA teams to stay compliant with regulations like **GxP** or **ISO standards**.

### 4. Regulatory Information Management (RIM)

Manages the process of **submitting drugs for approval** to health authorities (like FDA, EMA).

- **Veeva Vault RIM:**
  - Organizes regulatory submissions

- Tracks timelines, documents, and submission statuses

✓ Speeds up the process of getting a new drug approved and on the market.

---

## 5. 🎓 Training Management

Delivers and tracks **compliance training** for employees.

- **Veeva Vault Training:**
  - Assigns training modules (e.g., safety, SOPs)
  - Tracks completion and certifications

✓ Ensures all employees are trained and audit-ready.

---

## 6. 📊 Data & Analytics

- **Veeva Nitro:**
  - A commercial data warehouse for analyzing sales, marketing performance, and HCP engagement
- **Veeva Compass:**
  - Offers real-world data for patient journeys, treatment patterns, and sales analytics

✓ Helps commercial and marketing teams make data-driven decisions.

---

## 7. 🧠 AI & Automation

- Veeva integrates **AI agents** into many apps:
  - Auto-tagging documents
  - Recommending next-best actions for sales reps
  - Detecting compliance issues in content

✓ Saves time, reduces manual effort, and improves accuracy.

---

## 8. 🌐 Multichannel Engagement for Commercial Teams

- **Veeva CRM Engage:**
  - Enables virtual meetings between reps and doctors
  - Sends approved emails and remote content
- **Events Management:**
  - Plans and tracks medical conferences and HCP webinars

✓ Ensures **compliant engagement** with healthcare professionals (HCPs) across all channels.

---

## TL;DR: What Else Does Veeva Do?

| Area                    | Tool/Module            | Purpose                                       |
|-------------------------|------------------------|-----------------------------------------------|
| Clinical Trials         | Vault eTMF, CTMS       | Manage trial documents and site activities    |
| Quality & Compliance    | Vault QMS, QualityDocs | Ensure product quality and manage SOPs        |
| Regulatory Submissions  | Vault RIM              | Organize drug approval documentation          |
| Promotional Content     | Vault PromoMats        | Manage compliant brochures and advertisements |
| Training                | Vault Training         | Assign and track compliance training          |
| Data & Insights         | Nitro, Compass         | Analyze market data and drug usage patterns   |
| Multichannel Sales      | Engage, Events         | Virtual doctor meetings and event tracking    |
| Artificial Intelligence | Built-in AI tools      | Automate tagging, recommendations, alerts     |

## In Simple Words:

Veeva is **like the operating system for the pharmaceutical industry**—helping with everything from **testing new drugs** to **selling them**, while making sure everything is **safe, legal, and well-documented**.

Let me know if you want visual diagrams or a slide-style summary for these!

Now I want technical stuff of veeva from basics

Absolutely! Let's dive into the **technical side of Veeva**, starting from the **basics** and gradually getting more detailed.

## 1. What Is Veeva Technically?

Veeva is a **cloud-based software platform** built primarily for the **life sciences industry** (e.g., pharmaceuticals, biotech). It provides **SaaS (Software as a Service)** applications that run on:

- **Veeva Vault Platform** (Veeva's own backend)
- **Veeva CRM**, originally built on **Salesforce Force.com** platform (until 2025)

## 2. Veeva Vault Platform – The Core

### What is it?

A **low-code content + data management platform** built by Veeva from scratch.

### Key Components:

| Component                   | Description                                                  |
|-----------------------------|--------------------------------------------------------------|
| <b>Vaults</b>               | Individual applications like Vault QMS, Vault RIM, etc.      |
| <b>Documents</b>            | Secure, versioned files with audit trails                    |
| <b>Objects</b>              | Custom data structures (like database tables)                |
| <b>Workflows</b>            | Automate business processes (approval flows, training, etc.) |
| <b>Security &amp; Roles</b> | Fine-grained control over what users can see and do          |
| <b>APIs</b>                 | RESTful APIs for integration with external systems           |

## 3. Veeva Data Model Basics

### Objects

- Similar to tables in databases.
- Example: **Product\_\_c**, **Doctor\_\_c**, **Training\_\_c**

### Documents

- Content files like PDFs, videos, images, etc.
- Documents have metadata (e.g., version, status, owner)

### Workflows

- Used to automate approval processes, notifications, training assignments.
- Based on roles and document/object states.

## 4. Veeva CRM Architecture (On Salesforce)

Until 2025, **Veeva CRM** is built on the **Salesforce platform**, so it uses:

| Layer           | Technology                                              |
|-----------------|---------------------------------------------------------|
| UI              | Visualforce, Lightning (iOS app = iRep)                 |
| Logic           | Apex Code (Salesforce's Java-like language)             |
| Data Storage    | Salesforce Objects (custom + standard)                  |
| Integration     | REST/SOAP APIs, iRep sync                               |
| Offline Support | iRep (native iPad app) stores data locally, syncs later |

After 2025, Veeva CRM will be on **Vault CRM**, which will be fully hosted on the **Vault Platform** (not Salesforce).

## 5. Veeva API and Integration

Veeva supports integration with external systems using:

- **REST API** – Common for CRUD operations on documents/objects.

- **Vault Loader** – Bulk upload/import/export of data.
- **SDKs and Middleware** – Often integrated with ERP (e.g., SAP), EDMS, eCTD, etc.

Example REST API:

```
http

GET /api/v19.1/objects/Document/12345
Authorization: Bearer <access_token>
```

## 6. Technical Tools in Vault UI

- **Vault Configuration Console** – Define objects, fields, picklists, layouts.
- **Object Lifecycles** – Define how records progress through states (e.g., draft → approved).
- **Document Types & Subtypes** – Categorize uploaded documents.
- **Role-Based Access Control** – Define who can read, edit, delete specific records.

## 7. iRep App (For iPad)

- Built using native iOS + Veeva CRM APIs
- Offline capability: data is encrypted and stored locally
- Auto-syncs with Veeva CRM when online
- Used for:
  - Displaying CLM content (closed-loop marketing)
  - Capturing HCP interaction data
  - Logging sample drops

## 8. Common Veeva Vault Applications

| App                    | Use Case                              |
|------------------------|---------------------------------------|
| <b>Vault QMS</b>       | Quality processes (CAPAs, deviations) |
| <b>Vault RIM</b>       | Regulatory info/submissions           |
| <b>Vault PromoMats</b> | Marketing material management         |
| <b>Vault eTMF</b>      | Clinical trial documentation          |
| <b>Vault Training</b>  | Assign and track employee training    |

## 9. Security and Compliance

- **Audit Trail** for every action (who did what, when)
- **GxP-compliant** (21 CFR Part 11)

- **eSignatures** for approvals
- **Multi-factor Authentication (MFA)**
- **Single Sign-On (SSO)** with enterprise identity providers

## 10. Popular Roles in Veeva Ecosystem

| Role                     | Responsibility                                             |
|--------------------------|------------------------------------------------------------|
| Veeva Admin              | Configures Vault or CRM apps (fields, workflows, security) |
| Veeva Developer          | Writes code, scripts, API integrations                     |
| Business Analyst         | Maps life sciences processes to Veeva modules              |
| Data Steward             | Manages master data (HCP, products, etc.)                  |
| Clinical/Regulatory User | End-users managing trials, docs, training                  |

## TL;DR: Technical Summary

| Area             | Technology/Concept                             |
|------------------|------------------------------------------------|
| Backend Platform | Veeva Vault (custom) + Salesforce (until 2025) |
| App Types        | CRM, QMS, RIM, eTMF, PromoMats, Training       |
| Data Layer       | Objects (tables) + Documents (files)           |
| Workflows        | Approval flows, training assignments           |
| APIs             | REST, Vault Loader, Salesforce APIs            |
| Offline Support  | iRep for iPad                                  |
| Security         | GxP compliance, audit trails, SSO              |

Would you like me to create a **diagram of Veeva Vault architecture**, or walk through a **real use case (e.g., a drug submission)** from a technical point of view?

I want veeva crm or veeva Salesforce

Great! You're specifically interested in **Veeva CRM**, also known as **Veeva on Salesforce**. Let's do a deep dive into:

- ♦ What Veeva CRM is
- ♦ How it works technically (built on Salesforce)
- ♦ Key features for Medical Reps
- ♦ Architecture overview
- ♦ Developer/admin basics
- ♦ Real use case

- ♦ What's changing after 2025

## 1. What Is Veeva CRM?

**Veeva CRM** is a **Salesforce-based customer relationship management platform**, specially built for the **life sciences industry** (like pharma, biotech, med-tech companies). It helps Medical Representatives and Sales Teams to:

- Manage their **doctor visits**
- Show approved drug content (e.g. PDFs, videos)
- Record **HCP interactions**
- Track **samples given**
- Ensure all communications are **legal and compliant**

✓ Veeva CRM is NOT a generic CRM like Salesforce — it's **tailored for pharma**, with deep industry rules built-in.

## 2. Veeva CRM Technical Foundation

### Platform

- **Built on Salesforce Force.com**
- Uses Salesforce **Objects, Apex, Visualforce**, and **Lightning Components**
- Veeva adds **custom apps, metadata, and logic** specific to life sciences

### Key Concepts

| Concept     | Salesforce Equivalent                     | Veeva Customization                    |
|-------------|-------------------------------------------|----------------------------------------|
| Object      | Custom Object ( <b>Account, Contact</b> ) | Added fields for HCPs, products, etc.  |
| Apex        | Backend logic code                        | Used for custom workflows, validation  |
| Visualforce | UI templates                              | Custom pages for HCP details, CLM      |
| iRep        | iPad App                                  | Offline access to CRM with CLM content |

## 3. Veeva CRM Modules

| Module                   | Purpose                                                                      |
|--------------------------|------------------------------------------------------------------------------|
| <b>Veeva CRM</b>         | Main CRM for managing HCP interactions, accounts, call planning              |
| <b>CLM</b>               | Closed Loop Marketing – shows compliant presentations to doctors             |
| <b>Approved Email</b>    | Sends pre-approved emails to HCPs                                            |
| <b>Events Management</b> | Manages scientific conferences, webinars, or doctor roundtables              |
| <b>Medical CRM</b>       | For MSJs (Medical Science Liaisons) who need to track scientific discussions |

| Module      | Purpose                               |
|-------------|---------------------------------------|
| Veeva Align | Aligns reps with territories and HCPs |

## 4. iRep – The iPad App

- iRep is the **offline iPad app** version of Veeva CRM
- Works even in remote hospitals or rural areas
- Syncs when internet is available
- Supports:
  - HCP visit planning
  - Interactive presentations
  - Sample drop logging
  - Feedback capture
  - CLM tracking (what slides doctor viewed)

## 5. Developer/Admin View of Veeva CRM

### Admin Tasks

- Configure **Accounts, Products, Territories**
- Set up **Call Reporting Rules**
- Control access using **profiles, roles, and permissions**
- Deploy **CLM content** (PDFs, videos)

### Developer Tasks

- Use **Apex** to write triggers or classes
- Create **Visualforce** pages for custom interfaces
- Use **Veeva APIs** to:
  - Sync HCP and product data
  - Extract insights
  - Integrate with external systems (ERP, MDM, BI)

## 6. How Data Flows in Veeva CRM

plaintext

```

Master Data (HCP, Product, Territory)
  ↓
Loaded via Vault Loader / API
  ↓

```

```

Reps use iRep (iPad) for Calls
↓
Data (Calls, Samples, Feedback) stored offline
↓
Syncs with Veeva CRM backend
↓
Managers analyze data in dashboards (Reports, Nitro)

```

## 7. Real-Life Example

Imagine a sales rep visiting Dr. Rao.

### 1. Before Visit:

- Checks Dr. Rao's profile in iRep
- Sees what products were discussed previously
- Plans to promote a new diabetes drug

### 2. During Visit:

- Opens iRep on iPad
- Shows a **CLM** interactive slide deck (compliant)
- Logs call and gives samples

### 3. After Visit:

- Data syncs to central CRM
- Manager sees the doctor engagement report
- Marketing sees that Dr. Rao spent 1 min on slide 2 and asked a question

✅ All actions are **audited, compliant, and tracked**.

## 8. What's Changing After 2025?

- Veeva is **moving off Salesforce**.
- Veeva CRM will become **Vault CRM** (hosted fully on Veeva Vault platform).
- **Salesforce code (Apex, Visualforce)** will be **phased out**.
- Vault CRM will use **Veeva's own backend and frontend tech**.

But until 2025, companies will still:

- Use Salesforce-based Veeva CRM
- Build integrations using Salesforce APIs
- Deploy iRep and other tools on iOS

## TL;DR

**Veeva CRM** is a Salesforce-powered CRM system built specifically for life sciences. Medical reps use it (via iRep on iPad) to plan visits, show compliant materials, record feedback, and stay in line with strict healthcare regulations. It's deeply integrated with sales, marketing, compliance, and data systems.

Would you like a **Veeva CRM data model**, a sample **custom object setup**, or help building **Apex triggers for Veeva objects**?

What are the topics in veeva

Here's a comprehensive list of **topics in Veeva**, categorized by modules and user roles (Admin, Developer, Business User). These topics cover **Veeva CRM (Salesforce-based)**, **Vault**, and upcoming **Vault CRM** features.

## Veeva Topics (Full List)

### ♦ I. Veeva CRM (Salesforce-based)

#### ➤ Functional Topics

- Introduction to Veeva CRM
- Veeva vs Salesforce CRM
- Territory Management
- Call Reporting (HCP visits, detailing)
- Medical Events Management
- Sample Management & Compliance
- Approved Email
- Veeva CLM (Closed Loop Marketing)
- Multichannel Cycle Planning
- Account Management (HCPs, HCOs)
- Scheduling and Call Objectives
- Key Message Tracking

#### ➤ Technical Topics

- Veeva Objects (Call, Account, Product, CLM)
- Veeva Metadata (Custom fields, layouts)
- Veeva iRep (iPad offline access)
- Sync Architecture (Device ↔ Cloud)

- Apex Triggers for Veeva
- Visualforce Pages in Veeva CRM
- Lightning Components
- Veeva APIs (for integration)
- Data Loaders and ETL tools
- Vault integration with CRM

#### ► Admin Topics

- User & Role Management
- Veeva CRM Profiles and Permissions
- Territory Alignments
- Record Types and Page Layouts
- Multichannel Settings
- Object & Field Configuration
- Validation Rules
- Localization (Multi-country rollout)

---

## ◆ II. Veeva Vault Platform

#### ► Vault Functional Modules

- Vault PromoMats (Promotional Content)
- Vault MedComms (Medical Communications)
- Vault Quality (Quality Documents, SOPs)
- Vault QMS (Quality Management System)
- Vault RIM (Regulatory Information Management)
- Vault eTMF (Clinical Trials)
- Vault Training
- Vault Signal (Safety & Pharmacovigilance)

#### ► Vault Technical Topics

- Vault Object Model (VObjects)
- Document Lifecycle & Workflows
- Vault Configuration (Fields, Layouts)
- Role-Based Access Control
- Integration APIs (Vault REST APIs)
- Document Renditions & Anchoring

- Vault Loader (Bulk data load)
  - Vault UI customization (Tabs, Filters, Views)
  - Vault Reporting & Dashboards
- 

### ◆ **III. Veeva Commercial Ecosystem**

- Veeva Nitro (Commercial Data Warehouse)
  - Veeva Compass (Healthcare Analytics)
  - Engage Meeting (Virtual Rep-HCP meetings)
  - Engage Connect (HCP app)
  - Events Management (CRM module or Vault Events)
  - Medical CRM (For MSLs - Medical Science Liaisons)
- 

### ◆ **IV. Veeva Align & CRM MyInsights**

#### ➤ **Veeva Align (Territory Design)**

- Territory Modeling
- Account Assignments
- Rules Engine for Targeting
- Integration with CRM

#### ➤ **CRM MyInsights (Custom Dashboards)**

- Building Visual Dashboards in CRM
  - Using JSON & JavaScript
  - Integration with Call Reporting
- 

### ◆ **V. Latest: Vault CRM (Post-2025)**

- Vault CRM Introduction
  - Vault CRM vs Salesforce CRM
  - Migration Planning from Salesforce-based CRM
  - Vault CRM UI/UX
  - Vault CRM Data Model
  - Vault CRM SDK (JavaScript SDK)
  - Future-Proof CRM Strategy
- 

## **Categorized by Role**

| Role               | Suggested Topics                                                          |
|--------------------|---------------------------------------------------------------------------|
| CRM User (Rep)     | Call Reporting, CLM, iRep, Sample Management, Approved Email              |
| Admin              | Object setup, Permissions, Align, Multichannel config, Data sync          |
| Developer          | Apex triggers, Visualforce, Veeva APIs, MyInsights, Vault SDK             |
| Business Analyst   | Align, Cycle Planning, Analytics, Reporting, Medical Events, RIM workflow |
| Quality/Regulatory | Vault QMS, RIM, PromoMats, MedComms, eTMF, Document Lifecycle Management  |

## Want to Specialize?

Here are typical **career paths** within Veeva:

- **Veeva CRM Consultant** → Focused on Salesforce-based solutions
- **Veeva Vault Admin/Analyst** → Focused on PromoMats, Quality, MedComms
- **Veeva Vault Developer** → Working with Vault SDK & APIs
- **Veeva Integration Specialist** → Connects Veeva with ERP, MDM, or BI tools
- **Veeva Business Analyst** → Domain knowledge in Pharma + Veeva system usage

Would you like a **learning roadmap** for becoming a Veeva Consultant, Admin, or Developer?

. Veeva CRM (Salesforce-based)

► Functional Topics

Introduction to Veeva CRM

Veeva vs Salesforce CRM

Territory Management

Call Reporting (HCP visits, detailing)

Medical Events Management

Sample Management & Compliance

Approved Email

Veeva CLM (Closed Loop Marketing)

Multichannel Cycle Planning

Account Management (HCPs, HCOs)

## Scheduling and Call Objectives

Key Message Tracking--- explain all these in detail with multiple examples and scenarios

Here's a deep technical dive into each **functional topic** in **Veeva CRM (Salesforce-based)**—complete with real-world-style examples and scenarios. I've structured it to explain what each feature is and how it's used by field teams and managers.

## 1. Introduction to Veeva CRM

**What it is:** Veeva CRM is a specialized CRM built on Salesforce for life sciences teams—helping medical reps manage healthcare provider (HCP) interactions, compliance, events, emails, samples, CLM content, and more. [Veeva Systems+9](#)

**Scenario:** A pharma field rep uses iRep on an iPad every morning. They open the app to see scheduled doctor visits, prior call history, available compliant content, and sample inventory—all in one integrated view.

## 2. Veeva vs Salesforce CRM

**Key Difference:** While Salesforce CRM is general-purpose, **Veeva CRM adds pharma-specific workflows**—e.g., call reporting, sample tracking, CLM presentations, audit trails, and compliance right out-of-the-box. [Veeva Systems](#)

**Example:** A standard Salesforce rep records notes in a custom object. A Veeva rep uses **Call Reports**, which automatically log key messages, samples, HCP signatures, and tie into compliant workflows.

## 3. Territory Management

**What it is:** Defines which accounts (HCPs, hospitals) and doctors each user can access. Supports postal code or brick-based alignment, explicit loading, or Veeva Align scenario planning. [crmhelp.veeva.com](#)  
[vaultcrmhelp.veeva.com](#)

**Scenario:** A rep is assigned to “South Chennai territory”—iRep only syncs accounts mapped to that region. The admin uses postal-code alignment to auto-assign new clinics to this territory.

**Advanced:** With **Territory Fields**, users see territory-specific metrics like YTD visits or target status directly on account pages. [vaultcrmhelp.veeva.com](#)

## 4. Call Reporting (HCP visits, detailing)

**Overview:** Captures every interaction with HCPs—from scheduling to submission. Tracks products discussed, discussions, samples, key messages, expenses, attendees, and more. [crmhelp.veeva.com](#)  
[crmhelp.veeva.com](#)

**Example workflow:**

1. Plan call: rep schedules a visit.
2. During the call: selects doctor, records which product was detailed (Call Detail), logs discussion content (Call Discussion), marks key messages, and logs samples given.
3. Save, then submit: Once submitted, the call is audit-locked.

[crmhelp.veeva.com+6](#)

[crmhelp.veeva.com](#)

Rep types like MSLs or Event attendees use different **record types** to tailor data collected.

[crmhelp.veeva.com+1](#)

## 5. Medical Events Management

**What it is:** Used to record interactions that happen at **scientific conferences, seminars or large gatherings** (group calls). Provides a call record tied to an Event rather than individual HCP visits.

[crmhelp.veeva.com](#)[crmhelp.veeva.com](#)

**Example:** At a medical conference, several reps interact with a group of doctors—captured under an “Event\_vod” call type, tracking all doctors, products discussed, and materials distributed.

## 6. Sample Management & Compliance

**Feature Overview:** Enables admins and reps to track sample inventory, lot batches, returns, transfers, and ensure compliance. Supports electronic signatures and controlled substances. [crmhelp.veeva.com](#)  
[crmhelp.veeva.com](#)

**Scenario:**

- Admin creates **Rep Roster**, Sample Lot, and manages approvals.
- Rep visits a doctor, gives out two sample packs and obtains signature.
- Data logs automatically reduce on-hand inventory in Sample Management.
- During audit, the auditor can view each transaction tied to lots and user. [crmhelp.veeva.com](#)  
[crmhelp.veeva.com+2](#)

## 7. Approved Email

**What it is:** Enables reps to send **pre-approved, compliant emails** to HCPs directly from CRM, tracking opens and links clicked. [crmhelp.veeva.com](#)[crmhelp.veeva.com](#)

**Scenario:** After a call, the rep sends an approved drug brochure via email. CRM tracks that the doc opened it twice and clicked a link, which updates in dashboards and cycles.

## 8. Veeva CLM (Closed Loop Marketing)

**What it is:** Allows reps to deliver interactive content (slides, videos, animations) during visits. Tracks which slides were viewed, time spent, and actions taken. Content is hosted in Veeva Vault and accessed

from CRM. [crmhelp.veeva.com](https://crmhelp.veeva.com)

**Scenario:** A rep opens a 3-minute GLP-1 drug CLM deck. The doctor swipes through an efficacy graph and a mechanism-of-action video. CRM logs which slides were viewed and time; marketing analyzes this later for engagement insights.

## 9. Multichannel Cycle Planning (MCCP)

**What it is:** Enables planning and executing coordinated campaigns across channels—calls, emails, events, and CLM. Ensures each HCP gets a consistent message via planned touchpoints.

**Scenario:** A campaign around heart failure:

- Week 1: rep call with CLM deck
  - Week 2: approved email with study results
  - Week 4: invite to virtual webinar
- CRM tracks completion of each step across all reps automatically.

## 10. Account Management (HCPs, HCOs)

**What it is:** Manages different types of customer accounts—**HCPs (individual doctors)**, **HCOs (hospitals, clinics)**, affiliates, and hierarchies. Keeps demographics, specialty, past call history, affiliations, and preferences.

[crmhelp.veeva.com+2](https://crmhelp.veeva.com+2)

[crmhelp.veeva.com+8](https://crmhelp.veeva.com+8)

[Veeva Systems+3](https://veeva.com)

[crmhelp.veeva.com+13](https://crmhelp.veeva.com+13)

**Scenario:** A rep opens Dr. Ananya's account: sees her clinic affiliation, sample history, preferred communication method, previous call notes, and whether she's a Key Opinion Leader (KOL).

## 11. Scheduling & Call Objectives

**What it is:** Reps schedule visits via tasks or call objects. They define **call objectives** (e.g., introduce new product, follow-up on side effects). Objectives drive outcomes and planning.

**Scenario:** The call plan shows Dr. Ananya is due for a follow-up. The objective: discuss side-effect data. After the call, that objective is marked "completed"—driving cycle planning for next point of engagement.

## 12. Key Message Tracking

**What it is:** During each call, reps record which **pre-approved key messages** were delivered (e.g., efficacy, safety data, pricing). Helps standardize messaging and analyze which messages drive interest.

**Scenario:** On a refill call, the rep selects key message "Once-weekly dosing improves compliance." CRM logs it under call key messages. Marketing later correlates this message with increased prescribing.

## ✓ Summary Table

| Topic                              | Use Case / Example                                                            |
|------------------------------------|-------------------------------------------------------------------------------|
| <b>Territory Management</b>        | Auto-assign clinics to geography-based territory; sync only assigned accounts |
| <b>Call Reporting</b>              | Log doctor visits, products detailed, interactions, key messages, samples     |
| <b>Medical Events</b>              | Track doctor group sessions at conferences                                    |
| <b>Sample Management</b>           | Inventory tracking, lot-level auditing, signature capture                     |
| <b>Approved Email</b>              | Send pre-approved emails, track engagement                                    |
| <b>CLM</b>                         | Show interactive content, track slide-level engagement                        |
| <b>Multichannel Cycle Planning</b> | Orchestrate campaigns via calls, emails, webinars                             |
| <b>Account Management</b>          | Maintain comprehensive profiles for HCPs and healthcare organizations         |
| <b>Scheduling &amp; Objectives</b> | Plan calls with business goals, measure completion                            |
| <b>Key Message Tracking</b>        | Standardize messaging and measure effectiveness                               |

Would you like a process diagram showing how these modules link in a typical campaign (e.g. sample + CLM + approved email)?

Introduction to veeva crm in detail

Here's a **detailed explanation of "Introduction to Veeva CRM"**, including its purpose, components, benefits, real-world use cases, and how it's different from traditional CRM systems:

## 🌐 Introduction to Veeva CRM

### ✓ What is Veeva CRM?

**Veeva CRM** is a **cloud-based Customer Relationship Management solution** specifically designed for the **life sciences industry** (pharmaceuticals, biotech, medical devices). It helps **field reps, medical science liaisons (MSLs), and brand managers** to manage and enhance **customer engagement with healthcare professionals (HCPs) and healthcare organizations (HCOs)**—all while staying compliant with industry regulations.

It is built on **Salesforce.com** (Force.com platform), but it adds a specialized **life sciences layer**, preconfigured with modules for:

- Call reporting
- Sample management
- Territory alignment
- Closed Loop Marketing (CLM)
- Approved Email
- Events and campaigns

- Multichannel engagement

## Why Do Life Sciences Companies Need Veeva CRM?

The pharma and healthcare industries have **unique regulatory and engagement requirements**, such as:

- **Compliance with FDA/EMA regulations**
- Managing **drug sampling**
- Tracking **HCP interaction history**
- Sending **pre-approved compliant content**
- Maintaining **audit trails** for all activity

Traditional CRM systems (like vanilla Salesforce) don't cover these needs out of the box. Veeva CRM solves that.

## Core Components of Veeva CRM

| Module                             | Description                                                                                         |
|------------------------------------|-----------------------------------------------------------------------------------------------------|
| <b>Call Reporting</b>              | Tracks face-to-face and virtual visits with HCPs. Logs discussions, samples, and products detailed. |
| <b>Sample Management</b>           | Handles inventory, distribution, lot control, and compliance with regulations.                      |
| <b>CLM (Closed Loop Marketing)</b> | Interactive content presentations delivered during visits. Tracks engagement.                       |
| <b>Approved Email</b>              | Allows sending of only pre-approved, regulatory-compliant email content to HCPs.                    |
| <b>Account Management</b>          | Manages HCP and HCO profiles, affiliations, specialties, and preferences.                           |
| <b>Territory Management</b>        | Assigns reps to specific HCPs/HCOs based on geography or specialty.                                 |
| <b>Multichannel Cycle Plans</b>    | Plans coordinated engagement touchpoints (calls, emails, events).                                   |
| <b>Insights &amp; Analytics</b>    | Dashboards for sales performance, call coverage, and message effectiveness.                         |

## User Roles and How They Use Veeva CRM

| Role                                   | Usage Scenario                                                                   |
|----------------------------------------|----------------------------------------------------------------------------------|
| <b>Sales Reps</b>                      | Plan and report calls, deliver CLM content, record samples, send Approved Emails |
| <b>Medical Science Liaisons (MSLs)</b> | Record scientific discussions with HCPs, plan field activities                   |
| <b>Sales Managers</b>                  | Monitor team performance, review call quality, check territory coverage          |
| <b>Marketing Teams</b>                 | Analyze which messages/content drive engagement; update CLM assets               |
| <b>Compliance Officers</b>             | Track audit logs for all HCP interactions, ensure compliance with sampling laws  |

## A Typical Day Using Veeva CRM (Example)

 **Rep: Priya, Cardiovascular Sales Rep in Mumbai****1. Morning Planning:**

- Opens **iRep (Veeva CRM iPad app)**.
- Views her daily call list: 5 HCPs, each with specific call objectives (e.g., "Discuss latest hypertension data").

**2. First Visit:**

- Visits Dr. Raj.
- Opens **Call Report** → selects Dr. Raj's name → logs discussion on "Drug A".
- Plays a **CLM presentation** on efficacy rates.
- Offers 2 drug samples → captures **Dr. Raj's digital signature**.
- Marks the call complete.

**3. Post-Visit:**

- Sends a **compliant email** with a study attachment (Approved Email).
- All interactions are synced to Veeva CRM cloud and made visible to her manager.

**4. Evening Review:**

- Checks if all her calls and emails met the **Cycle Plan objectives**.
- Notes that Dr. Raj clicked the email link—this will be useful for follow-up.

 **Compliance and Regulatory Features**

- **Audit Trails:** Every interaction is timestamped and uneditable after submission.
- **Role-based Access:** Ensures only approved users can send emails, give samples, or view sensitive data.
- **Signature Capture:** Required for controlled substances or regulated samples.
- **Approved Content Only:** Reps can only share content that's legal and pre-reviewed.

 **Benefits of Veeva CRM**

| Benefit                                                                                                       | Description                                                                    |
|---------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
|  Industry-specific         | Tailored for pharma/biotech compliance and sales workflows.                    |
|  Mobile-first              | iPad/iPhone support for offline use in clinics and hospitals.                  |
|  Real-time data & insights | Managers see daily progress, call coverage, and product performance.           |
|  Regulatory Compliance     | Built-in features to ensure adherence to industry standards (FDA, HIPAA, etc.) |
|  Integrated Channels       | Enables seamless blending of digital and physical HCP interactions.            |

 **Veeva CRM vs Salesforce CRM**

| Feature               | Salesforce CRM         | Veeva CRM (on Salesforce)         |
|-----------------------|------------------------|-----------------------------------|
| Industry              | Generic (all sectors)  | Life sciences-specific            |
| Sampling & Compliance | Custom development     | Built-in sample compliance module |
| HCP/HCO Relationship  | Custom setup           | Native HCP/HCO modeling           |
| Approved Emails       | Not included           | Native with audit trail           |
| CLM Presentations     | Not available          | Built-in with analytics           |
| Offline iPad Use      | Requires customization | Native in Veeva iRep              |

## Conclusion

Veeva CRM is more than a CRM—it's an **end-to-end, compliant field execution platform** for **life sciences companies**. By integrating call planning, compliant content delivery, email, events, samples, and analytics, it empowers sales teams and MSLs to deliver **better HCP experiences while staying audit-ready**.

Veeva vs Salesforce in table

Here's a detailed **comparison table** showing the key differences between **Veeva CRM** and **Salesforce CRM**:

## Veeva CRM vs Salesforce CRM

| Feature / Category                 | Salesforce CRM                              | Veeva CRM (Built on Salesforce)                                 |
|------------------------------------|---------------------------------------------|-----------------------------------------------------------------|
| <b>Industry Focus</b>              | General-purpose (all industries)            | Life Sciences industry (Pharma, Biotech, Med Devices)           |
| <b>Platform</b>                    | Built on Salesforce Platform (Force.com)    | Built on Salesforce with industry-specific enhancements         |
| <b>HCP/HCO Management</b>          | Requires customization                      | Native support for HCPs (Doctors) and HCOs (Hospitals, Clinics) |
| <b>Sample Management</b>           | Not included                                | Built-in sample drop tracking, inventory, and compliance        |
| <b>Call Reporting</b>              | Customizable                                | Prebuilt workflows for field rep call reports                   |
| <b>Approved Email</b>              | Requires Pardot or Marketing Cloud          | Native compliant email tool (with audit and approval process)   |
| <b>CLM (Closed Loop Marketing)</b> | Requires integration with third-party tools | Native—multimedia content tracking during HCP presentations     |
| <b>Multichannel Engagement</b>     | Custom setup                                | Built-in cycle plans, call objectives, and channel blending     |

| Feature / Category                               | Salesforce CRM                                        | Veeva CRM (Built on Salesforce)                              |
|--------------------------------------------------|-------------------------------------------------------|--------------------------------------------------------------|
| <b>Territory Alignment</b>                       | Custom implementation                                 | Pre-configured for pharma rep territory and role assignment  |
| <b>Compliance (FDA, HIPAA)</b>                   | Must be built or integrated                           | Fully compliant out-of-the-box (audit trails, consent, etc.) |
| <b>Mobile/Offline Access</b>                     | Mobile available (requires customization for offline) | Native iRep iPad app with offline sync support               |
| <b>Medical Event Management</b>                  | Needs customization                                   | Built-in modules for managing medical education events       |
| <b>Integration with MedInfo, Safety, R&amp;D</b> | Manual/integrated separately                          | Seamlessly integrates with Veeva Vault for other functions   |
| <b>Deployment Time</b>                           | Longer due to custom development                      | Faster due to prebuilt pharma workflows and templates        |
| <b>Use Case Fit</b>                              | Generic sales, marketing, and service                 | Specifically for pharma field reps, MSLs, and marketers      |
| <b>Training Required</b>                         | More customization-dependent                          | Industry users find it easier due to tailored UI/flows       |
| <b>Pricing</b>                                   | Subscription-based (varies by product)                | Typically higher due to specialization but value-added       |

## Summary:

- Use **Salesforce CRM** if you want a **general CRM** for any business/industry and you're okay with building custom flows.
- Use **Veeva CRM** if you are in **life sciences**, need **field compliance, sampling, and approved marketing content delivery**, all in one package.

Territory management in detail with example and scenarios

Sure! Here's a **detailed explanation of Territory Management in Veeva CRM**, along with **examples and real-life scenarios** to help you understand its real-world application in the **pharmaceutical industry**:

## Territory Management in Veeva CRM

### What Is Territory Management?

**Territory Management** in Veeva CRM refers to the **assignment and organization of healthcare professionals (HCPs) and healthcare organizations (HCOs)** to specific **field reps, medical science liaisons (MSLs), or account managers** based on geography, specialization, product type, or business goals.

It ensures that:

- Each rep knows **which doctors/hospitals they are responsible for**
- There is **no overlap or confusion** between sales reps
- Performance and call planning can be **tracked by region, product, or team**

## Why Territory Management Matters in Pharma

In the pharmaceutical industry:

- Reps must be **compliant** with regulatory limits on calls/samples.
- Companies need to **avoid overlapping coverage** and inefficiencies.
- Territories change often due to **market shifts, new products, or rep transfers**.
- **Accurate reporting** is tied to territory structure.

## Key Components in Veeva CRM

| Component                         | Description                                                                  |
|-----------------------------------|------------------------------------------------------------------------------|
| <b>Territory</b>                  | A logical group (region, state, city, specialty) assigned to a rep/team      |
| <b>Territory Assignment Rules</b> | Rules that define how HCPs/HCOs are assigned (e.g., based on ZIP, specialty) |
| <b>Data Visibility Rules</b>      | Controls what a rep can see/edit—only accounts in their territory            |
| <b>Call Planning</b>              | Reps can schedule and log calls only for accounts in their territory         |
| <b>Territory Realignment</b>      | Moving accounts between reps/territories, often during restructuring         |

## Real-Life Example

### ♦ Scenario: Cardiologist Coverage in Bangalore

#### Dr. Mehta (Cardiologist)

- Located in **Bangalore**
- Interested in **heart medication – Drug A**
- Has consented to receive samples and email

#### Reps:

- **Ravi** covers **North Bangalore**, focusing on **cardiology**
- **Swathi** covers **South Bangalore**, general practitioners

### ➤ Territory Setup in Veeva

- Dr. Mehta is assigned to **Ravi's cardiology territory** because:

- He's in North Bangalore
- His specialty is Cardiology
- Ravi's Veeva iRep app shows Dr. Mehta in his **account list**.
- Swathi **cannot see or interact** with Dr. Mehta in Veeva.

## 🕒 Use Cases:

| Task                           | Outcome                                                  |
|--------------------------------|----------------------------------------------------------|
| Ravi schedules a visit         | ✅ Allowed (Dr. Mehta is in his territory)                |
| Ravi gives samples             | ✅ Allowed, and tracked against Ravi's sample inventory   |
| Swathi tries to call Dr. Mehta | ❌ Not allowed – outside her assigned territory           |
| Manager reviews coverage       | ✅ Can see Dr. Mehta's call frequency and Ravi's activity |

## 🔄 Territory Realignment Scenario

Let's say Ravi transfers to Chennai. A new rep, **Anita**, takes over **North Bangalore**.

- Veeva Admin performs a **Territory Realignment**:
  - Dr. Mehta is **removed from Ravi's view**
  - Dr. Mehta is **added to Anita's territory**
  - All call history remains, but only Anita can log new calls

This ensures:

- Seamless transition
- Proper tracking and visibility
- Compliance with call and sample laws

## 🔒 How Veeva Manages This Technically

| Feature                      | How Veeva Handles It                                                  |
|------------------------------|-----------------------------------------------------------------------|
| <b>Data Visibility</b>       | Role-based visibility via <b>Territory2Object</b> junction object     |
| <b>Call Reporting Limits</b> | Based on territory, reps cannot exceed sample call limits             |
| <b>Account Planning</b>      | Reps only plan for HCPs in their assigned territories                 |
| <b>Cycle Plan Objectives</b> | Custom objectives per rep/territory (e.g., 3 cardiologist calls/week) |

## 🚀 Benefits of Territory Management in Veeva

| Benefit                    | Description                                                     |
|----------------------------|-----------------------------------------------------------------|
| ✅ Better Coverage          | Ensures every account is properly covered without duplication   |
| 📈 Improved Productivity    | Reps focus on their accounts only, improving efficiency         |
| 🔒 Compliance & Audit Trail | Logs who is responsible for which doctor and tracks any changes |

| Benefit                                                                                            | Description                                                           |
|----------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|
|  Easy Realignment | Enables real-time territory shifts during re-org or rep transfers     |
|  Custom Planning  | Different goals, products, and messaging can be tailored by territory |

## Summary

**Territory Management** in Veeva CRM ensures:

- **The right rep talks to the right HCP**
- **No overlap, over-engagement, or compliance violations**
- **Sales teams can be realigned efficiently**
- **Performance can be tracked and optimized per territory**

Would you like a **diagram** of how territory assignment flows in Veeva, or details on how **territory rules are configured in Salesforce/Veeva backend**?

Now i want overview of Admin console with multiple examples and explain them all in detail

Here's an in-depth look at the **Veeva CRM Admin Console**—covering what it is, what admins can do with it, and real-world examples across modules like CLM, Approved Email, Multichannel Cycle Plans, and more. This is based on Veeva CRM as built on Salesforce as of mid-2025.

## What Is the Veeva CRM Admin Console?

The Admin Console is where **system administrators** and **business admins** manage key integrations and syncs between Veeva CRM and other systems like Veeva Vault, CLM content, Approved Email, and Multichannel Cycle Plans (MCCP).

Accessible via Salesforce tabs or specific Apex admin URLs (e.g., `/apex/CLM_Admin_vod`, `/apex/Approved_Email_Admin_Page_vod`, `/apex/MCCP_Admin_vod`)

[Veeva Support+11](#)

[Veeva CRM Help](#).

## Core Admin Consoles & Their Functions

### 1. CLM Admin Console

Used to manage integration with Veeva Vault for Closed-Loop Marketing content:

- Configure integration user credentials between CRM and Vault.
- Manage Vault connection instances.
- Define filtering clauses (e.g., language, content state).

- View sync history, error logs, and realign content when mismatched.

[Veeva CRM Help+2](#)

[Veeva CRM Help](#)

**Example:** You want to sync only English final versions of CLM decks. Set the Vault WHERE clause (`language__v = 'English'`) and exclude non-steady state content. When Dr. Rao's slides didn't sync due to a corrupted asset, you view the error log and retry the sync manually. [Veeva CRM Help](#)[Vault CRM Help](#)

## 2. Approved Email Admin Console

Manages integration of email templates from Vault:

- Integrate Vault email templates into CRM.
- Automatically generates Content\_Group\_Content\_vod records to map email content to user segments.
- Track sync history and fix failures. [Veeva CRM Help+14](#)

**Example:** You assign a study update email to a content group like "Cardiology\_Users." After syncing, only reps in that group can send the email. If sync fails due to missing group membership, you realign content and retry. [Veeva CRM Help](#)

## 3. Multichannel Cycle Plan (MCCP) Admin Console

Used to configure and run multichannel campaign planning:

- Set up user credentials and scheduling for MCCP.
- Review the status of the last 10 plan calculations (timestamps, success/failure).
- Use Veeva Process Scheduler to run automated or immediate calculations.

[Veeva CRM Help+11](#)

**Example:** Marketing team launches a campaign targeting diabetes HCPs. The admin triggers MCCP to generate cycle plans—Week 1 visits, Week 2 approved emails, Week 3 webinar invites. After execution, the scheduler shows all jobs ran successfully. [Veeva CRM Help](#)

## Common Admin Capabilities

### Integrations & Connection Management

- Define **integration users** with credentials for each connected system.
- Validate and maintain secure, consistent connection settings (especially with sandbox vs production environments). [Veeva CRM Help+15](#)

[Vault CRM Help+2](#)

### Sync Management & Error Handling

- Use **incremental sync**, **full refresh**, and **retry** functions for CLM and email content.

- View sync histories with timestamps, row counts, and failure codes.
- Realign mismatched groups or content assignments via console options.

[Vault CRM Help+4](#)

[Veeva CRM Help](#)

## Real-World Admin Scenarios

### Scenario 1: CLM Sync Error Fix

You're syncing new CLM slides into CRM, and some presentations fail to upload because of unmatched directories in CRM. You go to the CLM Admin Console, review the Subscription History and error messages, fix the metadata alignment, and rerun "Retry Failed." Content now appears in iRep and in CLM presentations available to reps. [Veeva CRM Help+1](#)

### Scenario 2: Approved Email Group Rollout

Marketing creates a new email newsletter from PromoMats. Admin assigns it to content group "Oncology Reps" and runs sync via the Admin Console. Assigned reps see the email template in CRM; others don't. If group membership changed afterward, you realign via the Admin Console to update user mappings. [Vault CRM Help+1](#)

### Scenario 3: Campaign Planning with MCCP

The admin launches a new MCCP (Multichannel cycle plan) to orchestrate a sequence: call > email > event. Admin visits MCCP Admin Console to verify job history. The scheduler shows the plan ran cleanly—no failures—and cycle plans were generated for all target docs. Reports are now available to field reps. [Veeva CRM Help](#)

## Additional Admin Features

### Localizing UI and Messages

Admins can customize UI text using **Vault Messages** and **Veeva Messages**, adjusting labels and error messages for usability across languages or regions. Messages are synchronized nightly but can also be triggered manually. [Vault CRM Help+3](#)

### Navigation via Apex URLs

Admin modules aren't always visible in the standard tab view. If hidden you can access them directly via their URLs:

- CLM: `/apex/CLM_Admin_vod`
- Approved Email: `/apex/Approved_Email_Admin_Page_vod`
- MCCP: `/apex/MCCP_Admin_vod`, etc. [Veeva Support+9](#)

## Admin Console Summary

| Module Admin Console         | Primary Tasks & Controls                                          | Example Use Case                                                    |
|------------------------------|-------------------------------------------------------------------|---------------------------------------------------------------------|
| CLM Admin Console            | Manage Vault syncs, content filtering, integration mapping        | Sync new CLM deck, resolve failed syncs                             |
| Approved Email Admin Console | Sync email templates, assign content groups, monitor log failures | Roll out a new study email to Oncology team                         |
| MCCP Admin Console           | Configure cycle plans, schedule runs, review job history          | Launch multichannel campaign and verify run success                 |
| Localization / Messages UI   | Customize in-app text and error messages for users                | Edit UI labels for local language users                             |
| Access via Apex URLs         | Directly open admin pages even if hidden from tab menu            | Navigate to MCCP admin page using <code>/apex/MCCP_Admin_vod</code> |

## ✓ TL;DR

The **Veeva CRM Admin Console** is where system and business admins configure and manage core integrations with Vault (for CLM and Approved Email), orchestrate multichannel planning, and localize the CRM interface. It includes tools for syncing content, assigning content groups, viewing job status, fixing sync errors, and customizing interface labels.

Would you like a visual diagram of content sync flow, or a walkthrough video of the CLM Admin Console in action?

### Data Access security

**Data Access Security in Veeva CRM** (built on Salesforce) ensures that users—like medical reps, managers, and administrators—can only access the data they are **authorized to see**, based on **roles, territories, and sharing settings**.

Here's a detailed breakdown with examples and scenarios:

## 🔒 What Is Data Access Security in Veeva?

Veeva CRM uses Salesforce's security model + Veeva-specific enhancements to protect data at **object**, **record**, and **field** levels.

| Security Layer | Purpose                                 | Controlled By                              |
|----------------|-----------------------------------------|--------------------------------------------|
| Object-level   | Can the user access the object at all?  | Profiles, Permission Sets                  |
| Record-level   | Can the user see this specific record?  | Role Hierarchy, Sharing Rules, Territories |
| Field-level    | Can the user see/edit a specific field? | Field-Level Security (FLS) via Profile     |

## 🧱 1. Object-Level Security

Controls which **objects** (like Accounts, Calls, CLM\_Presentation\_vod) a user can view, create, or modify.

✓ Example:

- A **Medical Rep** has access to Accounts, Calls, and CLM\_Presentation\_vod.
- A **Marketing User** can view CLM presentations but **cannot** create or submit calls.

🔧 Controlled via:

- **Profiles:** Role-specific baseline permissions.
- **Permission Sets:** Used to grant additional access on top of the profile.

## 2. Record-Level Security

Controls **which records** a user can access within an object. This is one of the most important security layers in Veeva CRM.

📌 **Key Components:**

| Feature                     | Description                                                                 |
|-----------------------------|-----------------------------------------------------------------------------|
| <b>Role Hierarchy</b>       | Users inherit access to records owned by their subordinates.                |
| <b>Territory Management</b> | Veeva-specific: assigns HCPs/accounts to reps based on territory alignment. |
| <b>Sharing Rules</b>        | Can be used to open up access to peers, assistants, or regions.             |
| <b>Manual Sharing</b>       | Ad hoc record sharing by users (if allowed).                                |

✓ Example Scenario:

- Dr. Anita (an HCP) is assigned to **Rep A** based on territory alignment. Only Rep A and their manager can see her Account record.
- If **Rep B** tries to search for Dr. Anita, they **won't see her account** unless:
  - The territory is shared.
  - A sharing rule gives access.
  - A manager manually shares it.

## 3. Field-Level Security (FLS)

Controls whether a user can **see or edit** a specific field on a record.

✓ Example:

- The **Sample Lot Number** field is **read-only** for reps but **editable** for compliance managers.
- **Approved Email Template Source** field is hidden from reps.

🔧 Controlled via:

- **Profile FLS settings**

- **Permission sets (recommended by Veeva)**

## 4. Veeva-Specific Security Features

| Feature                          | Description                                                            |
|----------------------------------|------------------------------------------------------------------------|
| <b>Data Change Capture (DCC)</b> | Tracks user changes to key data like HCPs and products.                |
| <b>Data Visibility Rules</b>     | Restrict account access based on license type or country.              |
| <b>Call Reporting Rules</b>      | Prevent reps from logging calls on unassigned or restricted HCPs.      |
| <b>CLM Sharing Rules</b>         | Limit which CLM presentations reps can use based on region or product. |

### Scenario:

- A rep in Germany cannot log a call with a **U.S.-only** HCP or use **US-approved** CLM slides.
- Marketing materials are filtered based on **Product Group + Territory + Role**.

## Practical Use Case: HCP Access Control

A company operates in India and Europe. HCPs are assigned to reps via **Territories**. Reps can only see HCPs and accounts aligned to their territory.

1. **Territory alignment** defines access to Account\_vod records.
2. **Profile** limits which objects reps can see (e.g., Call2\_vod, Inventory Monitoring).
3. **Permission sets** grant additional field access for special reps (e.g., high-tier access to CRM Call Notes).
4. **Field-level access** hides sensitive data like competitor interactions from basic users.

## Summary Table

| Security Layer              | Used For                               | Controlled By                     | Example                            |
|-----------------------------|----------------------------------------|-----------------------------------|------------------------------------|
| <b>Object-level</b>         | Access to objects like Call, Account   | Profile / Permission Sets         | Only Medical Reps can create Calls |
| <b>Record-level</b>         | Access to specific records             | Territories, Roles, Sharing Rules | Rep A sees only HCPs in Bangalore  |
| <b>Field-level</b>          | Access to individual fields            | Profile FLS / Permission Sets     | Sample ID is read-only for Reps    |
| <b>Territory Management</b> | Real-time record sharing via alignment | MyInsights, Align, Data Loader    | HCPs realigned from Rep A to Rep B |

Would you like a **diagram** or **real-time configuration example** (like how to restrict access to Calls based on Account type)?

## real-time configuration example

Here's a **real-time configuration example** of how **Data Access Security** works in **Veeva CRM**, using **Territory Management + Profile + Permission Set + Sharing Rules** to control which users can view or create **Call Reports** on **HCP (Account)** records.

## Scenario:

You want to allow **Rep A** (from the Cardiology team) to create call reports only for **Cardiologist HCPs in Territory X (Bangalore)** and restrict access to other specialists and territories.

## Step-by-Step Configuration:

### 1. Assign Profile & Permission Sets

- **Profile:** `Field_Rep_Profile`
  - Object Access: `Call2_vod` → Read, Create, Edit
  - Field-Level Access: Grant access to required fields like `Call_Datetime_vod__c`, `Call_Channel_vod__c`
- **Permission Set:** `Cardiology_Call_Access`
  - Gives additional access to `CLM_Presentation_vod`, `Sample_Transaction_vod`
  - Add restrictions based on specialist type (via formula field visibility if needed)

### 2. Territory Alignment

Use **Veeva Align** or **Territory2** model in Salesforce to assign HCPs to reps based on geography/specialty.

- HCP Dr. Anita (Cardiologist) → Assigned to **Territory X**
- Rep A → Assigned to **Territory X**

 This ensures only Rep A can access Dr. Anita's record.

 Tools used:

- **Veeva Align** or Data Loader
- Object: `Territory2`, `Account_Territory_Assignment__c`

### 3. Configure Record-Level Access

- **Sharing Rule 1:**

- Share **Accounts (HCPs)** where **Specialty\_\_c = Cardiologist** with **Role: Cardiology\_Rep**
- Access Level: Read/Write
- **Sharing Rule 2:**
  - Share **Call2\_vod** records **owned by reps in same territory** with **Regional Manager Role**

#### ✓ 4. Restrict Access to Non-Matching HCPs

If Rep A tries to search for **Dr. Sharma (Dermatologist)**:

- ✗ No territory match → Record not visible
- ✗ Sharing rules don't include dermatologists
- ✓ Security block is in effect

#### ✓ 5. Field-Level Restrictions

Rep A cannot see:

- **Competitor\_Mentioned\_\_c** (hidden via FLS)
- **OffLabel\_Promotion\_\_c** (only compliance officers can view this)

🔧 Controlled via:

- Field-Level Security in Profile
- Or via Permission Set that excludes these fields

#### ✓ Result:

| Task                                     | Rep A Allowed? | Reason                                |
|------------------------------------------|----------------|---------------------------------------|
| View Dr. Anita (Cardiologist, Bangalore) | ✓ Yes          | In same territory, matching specialty |
| Create Call on Dr. Anita                 | ✓ Yes          | Profile & permissions allow it        |
| View Dr. Sharma (Dermatologist)          | ✗ No           | Not in assigned territory/specialty   |
| View "Off-label Promotion" field         | ✗ No           | Field hidden via FLS                  |

#### 📌 Notes:

- Use **Call\_Objective\_vod** and **Multichannel Cycle Plans** to predefine allowed HCPs and call frequency.
- Use **Data Change Capture** to monitor if reps try to manually alter any unauthorized field or data.

online application ui setting

Here's a comprehensive overview of **Online Application UI Settings** for **Veeva CRM (Salesforce-based)** — focused on how admins can customize tab layouts, home screen widgets, UI labels, and behavior via settings and messages.

## 1. Tab Visibility & Navigation Bar Configuration

You can customize which navigation tabs appear on iPad or browser and the order they display.

- Use the **TAB\_NAV\_DISPLAY Veeva Setting** to define which tabs users see, and in what order. For example:  
`MyAccounts;;MySchedule;;Media;;CallObjectives;;Email`
- To customize labels, update the corresponding **Veeva Message entries**, e.g. relabeling “My Schedule” to “My Calls” [Vault CRM Help+9](#) [Veeva CRM Help](#).

### Example:

On iPad, if you only include “MyAccounts;;MySchedule;;Media;;CallObjectives;;Email”, only those five tabs appear—others are hidden or moved under “More.” The home tab always shows first.

## 2. Home Page Widget Configuration (iRep)

Customize the **order and presence of widgets** on the iPad home screen using the **VMobile Home Page Layout** object.

- Admins add marker fields (like **MySamples**, **Suggestions**, **MyTasks**) to the page layout in the desired sequence.
- The layout's order dictates the widget display order on the app [Veeva Support+1](#).

### Example:

If you need priority widgets “Samples” first, then “Call Objectives,” followed by “Suggestions,” you edit the page layout in that order → the iPad UI reflects it accordingly.

## 3. Custom Labels via Veeva Messages & Profile Settings

Admins control the text labels both online (browser) and offline (iPad) via a combination of:

- **Salesforce Setup** for standard object/tab labels (e.g., **Account**, **Call Report**)
- **Veeva Message object** for custom screens without underlying Salesforce object like “My Schedule” or error messages [Veeva CRM Help](#).

You can change button names or UI titles centrally via editing the Veeva Message entries.

### Example:

You could rename “Media” tab to “Detailing Decks” by updating the **MEDIA; ;IPAD** message value to “Detailing Decks”.

## 4. Profile-Specific UI Settings (via Application Profiles)

Use **Application Profiles** to manage UI configuration groups of users: tabs, home widgets, messages, and VMOCs.

- Create a profile for groups (e.g., “Cardiology Reps”) and assign specific settings via Veeva Setting records.
- Users under a profile inherit navigation layouts, allowed tabs, and UI configurations automatically  
[Vault CRM Help+15](#) [Vault CRM Help](#).

### Example:

A “Manager Profile” may enable extra tabs like “Coaching Reports” whereas a “Rep Profile” shows only day-to-day tabs like “Schedule” and “Call Objectives.”

## 5. Custom Settings for Functional Behavior

Crystalize UI behavior with **Veeva Settings (custom settings)**. Some useful ones include:

[Veeva CRM Help+1](#)

| Setting                               | Description                                    |
|---------------------------------------|------------------------------------------------|
| ENABLE_OFFLINE_CALL_OBJECTIVES_vod__c | Shows Call Objectives tab offline in iRep      |
| ENABLE_IPAD_MYSAMPLES_vod             | Enables “My Samples” tab in the iRep interface |
| ENABLE_INVENTORY_WORKSHEET_vod        | Adds worksheet link to sample tracking         |
| ENABLE_OFFLINE_VINSIGHTS_vod          | Enables offline access to VInsights dashboard  |

### Example:

If **ENABLE\_OFFLINE\_CALL\_OBJECTIVES\_vod\_\_c** is checked for a profile, reps will see the “Call Objectives” tab in their iPad even without network, making planning available offline.

## 6. UI Behavior via Lightning Transition

- Veeva CRM supports **Lightning UX** starting 2024; classic UI is deprecated. Admins should upgrade to benefit from modern UI elements  
[Veeva CRM Help+5](#)  
[Veeva CRM Help+2](#) .
- Be cautious with standard lookup fields: Lightning “+” create button bypasses Veeva logic—use configurable lookup filters to prevent this.

## Example Configurations

## Scenario A: Streamlined Rep Interface

- **Goal:** Reps see only essential tabs—Accounts, Schedule, Media, Call Objectives, Email.
- Configure `TAB_NAV_DISPLAY` setting.
- Hide unused tabs, rename labels as needed.
- Order widgets via `VMobile Home Page Layout`.

## Scenario B: Managers and Insights

- **Goal:** Managers need additional access to Coaching Reports and Territory Feedback.
- Create Application Profile “Managers”, add those tabs to `TAB_NAV_DISPLAY`.
- Use profile-specific Veeva Messages for button names.

## Scenario C: Offline Capabilities

- **Goal:** Reps using iRep offline can still access their objectives and sample data.
- Enable `ENABLE_OFFLINE_CALL_OBJECTIVES_vod__c` and `ENABLE_IPAD_MYSAMPLES_vod` for Rep profiles.
- Widgets on homepage load and sync automatically when online.

## ✓ Summary

- **Tab navigation, widget order, labels, and offline capabilities** are fully configurable through a combination of **Veeva Settings, Veeva Messages, Application Profiles, and Lightning UI configuration**.
- These configurations ensure **role-based UX tailoring**—simplified screens for field reps, expanded access for managers.
- Settings control both **what users see** and **how the interface behaves offline vs online**.

Let me know if you'd like a **visual diagram, sample XML of settings**, or a walkthrough of the UI in a sandbox org.

Veeva setting and veeva messages

Here's a detailed breakdown of **Veeva Settings** and **Veeva Messages**, two core configuration tools in **Veeva CRM** (Salesforce-based), explained with examples and use cases.

## 🔧 1. Veeva Settings

### ✓ What is a Veeva Setting?

- Veeva Settings are **custom configuration values** used to enable, disable, or customize functionality within Veeva CRM.
- They're stored in the **Veeva Settings custom setting** object in Salesforce.
- Used mostly by **Admins** to configure global or profile-specific behavior.

## Where are they found?

Setup → Custom Settings → Veeva Settings → Manage

## Format:

Each setting has:

- **Name** (e.g., TAB\_NAV\_DISPLAY)
- **Value** (e.g., MyAccounts;;MySchedule;;Media;;CallObjectives)

## Common Examples:

| Setting Name                    | Purpose                                              | Example Value                 |
|---------------------------------|------------------------------------------------------|-------------------------------|
| TAB_NAV_DISPLAY                 | Controls visible tabs on iRep (iPad app)             | MyAccounts;;MySchedule;;Email |
| ENABLE_CALL_OBJECTIVES_vod      | Enables the Call Objectives feature                  | TRUE                          |
| ENABLE_APPROVED_EMAIL_vod       | Enables Approved Email sending capability            | TRUE                          |
| DEFAULT_CALL_LOCATION_TYPE_vod  | Default value for call location                      | Office                        |
| ENABLE_OFFLINE_SYNC_LOGGING_vod | Enables sync error logging for offline use           | TRUE                          |
| DEFAULT_SYNC_START_DATE_vod     | Sets the sync start date range for initial data load | 2022-01-01                    |

## Example Scenario:

**Goal:** Show only key tabs to reps on iPad – My Accounts, My Schedule, Media, Email.

- Set TAB\_NAV\_DISPLAY to MyAccounts;;MySchedule;;Media;;Email
- Result: Only these tabs appear in the iPad version of Veeva CRM.

## 2. Veeva Messages

### What is a Veeva Message?

- Veeva Messages are **key-value pairs** that define **UI labels**, **error messages**, and **informational prompts** across Veeva CRM.

- Used for **UI customization** and **localization** (multi-language support).
- Helpful for **renaming standard labels**, showing **custom warnings**, or **controlling help text**.

## Where are they found?

App Launcher → Veeva Messages

## Fields:

- **Name:** Unique message key (e.g., `MEDIA;;IPAD`)
- **Text:** The label/message that appears to the user (e.g., `Detailing Decks`)

## Common Examples:

| Name (Key)                          | Text (Value)                                 | Purpose                                      |
|-------------------------------------|----------------------------------------------|----------------------------------------------|
| <code>MEDIA;;IPAD</code>            | <code>Detailing Decks</code>                 | Renames the "Media" tab to "Detailing Decks" |
| <code>MYACCOUNTS;;IPAD</code>       | <code>Customers</code>                       | Changes "My Accounts" to "Customers"         |
| <code>ERROR_SAMPLES_REQUIRED</code> | <code>Please select a sample product.</code> | Custom error message                         |
| <code>CALL_REPORT_HEADER</code>     | <code>Visit Summary</code>                   | Replaces default header on call report       |

## Example Scenario:

**Goal:** Rename the "MyAccounts" tab to "HCP Accounts" for field reps.

- Create a Veeva Message:
  - Name: `MYACCOUNTS;;IPAD`
  - Text: `HCP Accounts`
- Result: The tab label in the iRep app becomes "HCP Accounts" instead of "MyAccounts."

## Comparison: Veeva Settings vs Veeva Messages

| Feature    | Veeva Settings                                 | Veeva Messages                                  |
|------------|------------------------------------------------|-------------------------------------------------|
| Purpose    | Functional configuration                       | UI text customization and localization          |
| Used For   | Enabling/disabling features, defining behavior | Labels, error messages, UI language             |
| Applies To | Application logic                              | User interface                                  |
| Example    | <code>ENABLE_CALL_OBJECTIVES_vod = TRUE</code> | <code>CALL_REPORT_HEADER = Visit Summary</code> |

## Best Practices

- Use **Veeva Settings** for **functional setup**.
- Use **Veeva Messages** for **UI control and language adjustments**.
- Leverage **Application Profiles** to apply profile-specific settings and messages.
- Test changes in a **sandbox** before deploying to production.

Let me know if you'd like a **full list of commonly used Veeva Settings & Messages**, or if you want a **sandbox configuration scenario** step-by-step.

explain My Accounts Configurations in detail with examples

Here's a **detailed explanation of the “My Accounts” configuration in Veeva CRM**, including how it works, how to customize it, and real-life examples.

## ✓ What is “My Accounts” in Veeva CRM?

**My Accounts** is a central tab or module in Veeva CRM where users (especially field reps) can:

- View and manage **Accounts** (e.g., HCPs – doctors, and HCOs – hospitals)
- Segment/filter accounts by territory, specialty, cycle plan, etc.
- Launch **call reports**, **CLM presentations**, or **emails** directly

📱 This is one of the most-used features in **iRep** (Veeva's iPad app).

## 🔧 How is “My Accounts” configured?

### 🔧 1. Object: Account

- The **Account** object stores all HCP (Healthcare Professional) and HCO (Healthcare Organization) data.
- Fields include:
  - **Name**
  - **Specialty\_\_c**
  - **Territory\_vod\_\_c**
  - **Account\_Status\_vod\_\_c**
  - **Primary\_Address\_vod\_\_c**, etc.

### 🔧 2. Custom Tabs Display

You can **control which tabs are visible** (MyAccounts, MySchedule, etc.) using:

- ♦ **Veeva Setting:** TAB\_NAV\_DISPLAY
- ♦ Value Example: MyAccounts;;MySchedule;;Media;;Email

📌 Set in: Setup → Custom Settings → Veeva Settings → Manage

### 🔧 3. Filtering Records

You can restrict which accounts appear in “My Accounts” using:

- **Territory assignment**
- **Data Visibility Rules**
- **Custom Filters in Account\_List\_vod**

✅ Example:

Only show **Cardiologists** in **Bangalore territory**:

```
sql

SELECT Id, Name, Specialty_vod__c
FROM Account
WHERE Specialty_vod__c = 'Cardiology'
AND Territory_vod__c = 'Bangalore'
```

### 🔧 4. Search Layouts & Mobile Cards

- **Search Layouts** (for web): Define columns in My Accounts view
- **Mobile Cards** (for iRep): Define the info shown per account (image, HCP name, last visit)

🔧 Object: Account\_Mobile\_Card\_vod\_\_c

✅ Example Mobile Card shows:

- HCP Photo
- Name
- Last Call Date
- Product Affiliation

### 🔧 5. My Accounts Views

Admins can configure **Account Views** (like saved filters):

- By Territory
- By Account Type
- By Product Affiliation
- By Multichannel Activity

📍 Found in:

MyAccounts tab → Filter icon → View Selector

✅ Example:

### View: High-Priority Cardiologists

- Specialty = Cardiology
- Status = Active
- Multichannel Score > 75%

## 6. Actions from My Accounts

Users can:

- Tap on an account → Launch Call Report
- Launch Approved Email
- Launch CLM Presentation
- View Account History
- View Key Messages discussed

All these actions depend on **permissions and configuration** in:

- Call2\_vod
- Email\_Channel\_vod
- CLM\_Presentation\_vod
- Account\_Plan\_vod

## Real-Life Example Scenario

 **Rep Name:** John

📍 **Territory:** Bangalore

 **Product:** LipidControl

 **Goal:**

John should only see **Cardiologists** in Bangalore and be able to launch a Call Report or send an Approved Email.

### Config Steps:

1. Account records are assigned to Territory = Bangalore
2. Field **Specialty\_\_c** = 'Cardiology'
3. Veeva Setting **TAB\_NAV\_DISPLAY** includes **MyAccounts**
4. Profile **Field\_Rep\_Profile** allows access to Account, Call2\_vod, Email\_Channel\_vod

5. Custom Account View: "Bangalore Cardiologists"
6. Mobile Card shows photo, last visit, specialty
7. Action buttons available: **Call, Email, View History**

### Example Use Case (iPad flow):

1. John logs in → Opens "My Accounts"
2. Sees a list: Dr. Rao, Dr. Anita, Dr. Khan (All Cardiologists in Bangalore)
3. Taps Dr. Anita → Opens mini-profile
4. Clicks "Call" → Launches Call Report
5. After visit → Sends Approved Email → Logs interaction

## Related Security Considerations

| Area                 | Controlled By                        |
|----------------------|--------------------------------------|
| Which Accounts shown | Territory Assignment + Sharing Rules |
| Actions available    | Profile Permissions + Object Access  |
| Mobile Card Info     | Field-Level Security                 |

## Summary

| Component              | Description                                      |
|------------------------|--------------------------------------------------|
| <b>TAB_NAV_DISPLAY</b> | Controls visibility of the "My Accounts" tab     |
| Territory Assignment   | Limits accounts shown to user's assigned area    |
| Account Views          | Custom filters/sorting for reps                  |
| Mobile Cards           | Custom layout of account info on iPad            |
| Actions                | Call, Email, CLM, History – based on permissions |

Would you like a **configuration demo in Salesforce/Veeva sandbox**, or help with creating a **custom view or mobile card layout** for your use case?

account object configuration

Here's a detailed explanation of the **Account Object Configuration** in **Veeva CRM**, including fields, layout, customization, visibility, and real-world examples.

## ◆ What is the Account Object in Veeva CRM?

In Veeva CRM, the **Account** object represents:

- **HCPs (Healthcare Professionals)** – e.g., Dr. Smith
- **HCOs (Healthcare Organizations)** – e.g., St. Mary's Hospital

This is the **core object** used in Call Reporting, Territory Alignment, Multichannel Engagement, and CLM.

It is an extension of the **Salesforce Account** object with **Veeva-specific fields and relationships**.

## Structure of Account Object

### 1. Standard Fields (Inherited from Salesforce)

| Field          | Description                   |
|----------------|-------------------------------|
| Name           | Full name of the HCP or HCO   |
| AccountNumber  | Unique number for the account |
| Phone, Email   | Contact info                  |
| BillingAddress | Main address for the account  |
| Owner          | Assigned CRM user             |

### 2. Veeva-Specific Fields

| Field Name                     | Purpose                                                   |
|--------------------------------|-----------------------------------------------------------|
| Primary_Specialty_vod__c       | Specialization like Cardiology, Oncology, etc.            |
| Account_Type_vod__c            | Indicates HCP vs HCO                                      |
| Status_vod__c                  | Active, Inactive, Targeted                                |
| Territory_vod__c               | Territory assignment for access control                   |
| Primary_Address_vod__c         | Linked to <b>Address_vod</b> object for address hierarchy |
| Consent_Type_vod__c            | Consent for Approved Email or Digital Materials           |
| Affiliation_vod__c             | Relationships to other HCPs or HCOs                       |
| Call_Channel_Preference_vod__c | In-person, Virtual, Email, etc.                           |

## Account Object Configuration

### 1. Page Layouts

- Create different **layouts** for HCPs and HCOs
- Example: HCP layout shows specialties, HCO layout shows affiliations

 Setup:

Object Manager → Account → Page Layouts → Assign by Profile or Record Type

### 2. Record Types

Allows different flows for HCP and HCO.

| Record Type Name | Used For                 |
|------------------|--------------------------|
| HCP_vod          | Healthcare Professionals |
| HCO_vod          | Healthcare Organizations |

### 3. Field-Level Security

- Restrict visibility to compliance-sensitive fields like:
  - Off\_Label\_Promotion\_\_c
  - Consent\_Collected\_By\_\_c

 Setup:

Object Manager → Account → Fields → Set Field-Level Security per profile

### 4. Validation Rules

Ensure data integrity.

 Examples:

plaintext

If Account Type = HCP → Specialty must be filled  
If Status = Active → Address must not be blank

### 5. Account Relationships

- Affiliation\_vod\_\_c:** Maps HCP to HCOs (e.g., Dr. A works at Apollo Hospital)
- Parent Account:** For group practices or hospital networks

### 6. Integration with Call Reporting

Every **Call2\_vod\_\_c** references an **Account\_vod\_\_c**

→ The Account must be **visible** and **in the same territory** as the user to log a call.

### 7. Address Management

- Managed via **Address\_vod\_\_c** object
- Primary\_Address\_vod\_\_c** stores the main address ID
- Users can launch a call from address-level granularity

### Real-Life Example

**Rep Name:** Priya  
**Territory:** Mumbai  
**Product:** GlucoStat

 **Account: Dr. Ramesh**

| Field                    | Value         |
|--------------------------|---------------|
| Name                     | Dr. Ramesh K. |
| Account_Type_vod__c      | HCP           |
| Primary_Specialty_vod__c | Diabetology   |
| Status_vod__c            | Active        |
| Territory_vod__c         | Mumbai_1      |
| Consent_Type_vod__c      | Email_Consent |

Priya sees Dr. Ramesh under **My Accounts**, can launch a **Call Report**, and send **Approved Emails** based on consent.

## Integration Points

| Feature        | Account Usage                         |
|----------------|---------------------------------------|
| Call Reporting | Account is selected on call           |
| CLM            | Track messages shown to each account  |
| Approved Email | Consent-based communication           |
| Medical Events | Assign HCPs to an event               |
| Veeva Align    | Manage account-to-territory alignment |

## Summary

| Feature                | Description                           |
|------------------------|---------------------------------------|
| Record Types           | Separate layout/flow for HCP vs HCO   |
| Territory Control      | Determines user access and visibility |
| Custom Fields          | Tailored fields for life sciences     |
| Layouts + Mobile Cards | Controls display in iRep              |
| Relationship Mapping   | Affiliations between HCPs and HCOs    |
| Integration            | Central in Call, CLM, Email, Events   |

Would you like a **JSON/XML metadata template**, or help with **custom layouts** or **validation rules** for your use case?

sphere of influence, affiliation, account hierarchy

Let's break down **Sphere of Influence**, **Affiliation**, and **Account Hierarchy** in **Veeva CRM**, with real-life examples and how they're used by medical reps and commercial teams.

---

## 1. Sphere of Influence (SOI)

### Definition:

The **Sphere of Influence** refers to **all people and organizations that influence a Healthcare Professional (HCP)** — directly or indirectly — including nurses, peers, administrators, and institutions.

### Purpose:

To map how **HCPs are connected** in the healthcare ecosystem and influence **prescription behavior or decisions**.

### Example:

Dr. Mehta (Cardiologist) is:

- **Influenced by:** Dr. Rao (Department Head), who guides treatment protocols.
- **Influences:** Nurse Priya and Junior Doctor Rishi.

 You map these using **Affiliation records** in Veeva.

---

## 2. Affiliation

### Definition:

An **Affiliation** is a relationship between **two Account records** — typically between:

- HCP ↔ HCP (e.g., mentor–mentee)
- HCP ↔ HCO (e.g., Dr. A works at XYZ Hospital)

 **Stored in:** `Affiliation_vod__c` object

Each record includes:

- From Account
- To Account
- Role (e.g., employee, influencer)
- Influence Strength (Low/Med/High)

### Example:

- Dr. Sharma → Affiliated to Fortis Hospital as “Senior Consultant”
- Dr. Sharma → Affiliated to Dr. Gupta as “Mentor”
- Dr. Gupta → Influence Strength = High on Dr. Sharma

 **Usage:**

- Helps reps **target the right people**
- Visualize networks using "**Influence Map**" in iRep/iPad

 **3. Account Hierarchy** **Definition:**

The **Account Hierarchy** in Veeva shows **organizational structure** — such as:

- Parent Hospital Group
- Subsidiaries
- Departments
- Clinics

 **Achieved via:**

- **ParentId** (on Account object)
- Or with **custom hierarchy object** (e.g., `Account_Hierarchy_vod__c`)

 **Example:**

SCSS

```

Max Healthcare (Parent Account)
├── Max Hospital Delhi
│   ├── Cardiology Department (HCO)
│   └── Oncology Department (HCO)
└── Max Hospital Mumbai
    └── Dr. A (HCP - works in Oncology)

```

 **Usage:**

- Assign products based on **organization level**
- Understand reach of HCPs across **multiple branches**
- Roll-up reporting of activity at group level

 **Summary Table**

| Feature             | Definition                                   | Example                                 | Stored In                   |
|---------------------|----------------------------------------------|-----------------------------------------|-----------------------------|
| Sphere of Influence | Map people/orgs influencing HCPs             | Dr. Rao influences Dr. Mehta            | Visualized via Affiliations |
| Affiliation         | Link between 2 Accounts (HCP↔HCP or HCP↔HCO) | Dr. Sharma ↔ Fortis Hospital (Employee) | <b>Affiliation_vod__c</b>   |
| Account             | Org structure with parent-child              | Max Healthcare → Max                    | <b>ParentId</b> on Account  |

| Feature   | Definition    | Example       | Stored In |
|-----------|---------------|---------------|-----------|
| Hierarchy | relationships | Delhi → Dr. A |           |

## Real-World Use Case

 You're a rep visiting Dr. A in Fortis Bangalore.

- iRep shows **Affiliations**: Dr. A works in Oncology + mentored by Dr. B
- **Sphere of Influence Map**: Shows Dr. B influences Dr. A + is a Key Opinion Leader
- **Hierarchy**: Fortis Bangalore is part of Fortis Healthcare → your call is tagged to the correct regional manager

Would you like:

# Understanding Account Relationships in Veeva CRM

- Sphere of Influence
- Affiliation
- Account Hierarchy

## sample management in detail with examples

Here's a **detailed explanation of Sample Management** in **Veeva CRM**, including real-life examples, key functionalities, and compliance considerations:

## What is Sample Management?

**Sample Management** in Veeva CRM enables pharma companies to **track the distribution of drug samples** to healthcare professionals (HCPs) in a compliant, transparent, and auditable way — as required by regulatory bodies like the **FDA (21 CFR Part 11)** and **Sunshine Act**.

## Core Features

| Feature                          | Description                                                       |
|----------------------------------|-------------------------------------------------------------------|
| <b>Sample Inventory</b>          | Tracks available stock with each field rep                        |
| <b>Sample Request/Drop</b>       | Captures real-time data of sample deliveries or requests by HCPs  |
| <b>Signature Capture</b>         | Digital signatures collected via iRep/iPad to acknowledge receipt |
| <b>Sample Disbursement Audit</b> | Compliance audit trails for who got what, when, and how           |
| <b>State License Checks</b>      | Verifies HCP licenses before allowing a sample drop               |
| <b>Returns and Adjustments</b>   | Handles damaged, expired, or recalled product returns             |

## Real-Life Example

### Scenario: Medical Rep Visits Dr. Rao

- **Rep:** Ramesh from Abbott
- **HCP:** Dr. Rao (Cardiologist)
- **Product:** Lipicure (Cholesterol medicine sample)
- **Location:** Bangalore

### What Happens:

#### 1. Before the Visit:

- Ramesh logs in to **Veeva iRep** on his iPad.
- He checks **inventory** → has 20 units of Lipicure.

#### 2. During Visit:

- Dr. Rao requests **3 samples**.
- Ramesh initiates a **Call Report**.
- He selects "**Sample Drop**" and enters:

- Product: Lipicure
- Quantity: 3
- Lot Number: Auto-filled

### 3. Signature:

- Dr. Rao signs directly on the iPad (compliant with **21 CFR Part 11**).
- Veeva CRM logs the signature with timestamp and location.

### 4. After Visit:

- The sample count is updated (17 units left).
- Call and sample details are sent to backend.
- Report generated for audit/compliance team.

## Types of Sample Transactions

| Transaction Type     | Description                                | Example                              |
|----------------------|--------------------------------------------|--------------------------------------|
| Sample Drop          | Physical handover of drug samples to HCP   | 3 units of Lipicure given to Dr. Rao |
| Sample Request       | HCP asks for samples to be delivered later | Request for 5 units next week        |
| Sample Return        | Rep returns expired or damaged samples     | 2 damaged units returned             |
| Inventory Adjustment | Manual correction due to loss/miscount     | 1 unit lost, adjusted in system      |

## Compliance Requirements

- ♦ **Audit Trail** of each transaction
- ♦ State license validation for every HCP
- ♦ Capture **reason codes** for adjustments/returns
- ♦ Secure, tamper-proof **digital signatures**
- ♦ Integration with **compliance systems** (e.g., Aggregate Spend reporting)

## Veeva Objects Involved

| Object                    | Purpose                                    |
|---------------------------|--------------------------------------------|
| Sample_Order_vod__c       | Main object for sample transactions        |
| Sample_Transaction_vod__c | Tracks each individual movement of samples |
| Inventory_vod__c          | Holds rep's current stock                  |
| Signature_Page_vod__c     | Stores HCP signature and metadata          |

## Integration Example

Veeva CRM ↔ SAP:

- Once sample inventory is updated in Veeva, SAP backend reflects the update for logistics & fulfillment.

## Summary

Sample Management ensures that:

- ✓ **Medical reps deliver samples efficiently**
- ✓ **Compliance is maintained at all times**
- ✓ **Audit reports are available when needed**
- ✓ **Inventory is tracked and controlled accurately**

iRep configuration basics with examples

Here's a **complete beginner-friendly explanation of iRep configuration in Veeva CRM**, including real-world examples, use cases, and key configuration components.

## What is iRep?

**iRep** is the **Veeva CRM iPad app** used by field reps (like medical reps) to:

- Log calls/visits to doctors (HCPs)
- Drop samples
- Show digital presentations (CLM)
- Send Approved Emails
- Work **online or offline**

It's built on **Salesforce** and synced to the iPad for offline use.

## iRep Configuration Basics

iRep uses **Salesforce metadata** and custom **Veeva objects/settings** for its configuration. It allows the UI, content, workflows, and offline behavior to be tailored for users.

## 1. Veeva Settings (Veeva\_Settings\_vod)

This object stores configuration options that **control features and behavior in iRep**.

### ✓ Example:

| Field                         | Value | Description                       |
|-------------------------------|-------|-----------------------------------|
| Enable_CLM_vod                | TRUE  | Enables CLM presentations on iRep |
| Enable_Offline_Call_Entry_vod | TRUE  | Allows call entry when offline    |
| Enable_Signature_vod          | TRUE  | Enables digital signature capture |

You set these in Salesforce Setup → Veeva Settings tab or **Veeva\_Settings\_vod\_\_c** records.

## 2. VMOCs (Veeva Message Object Configuration)

VMOCs control data sync between Salesforce and the iPad.

### ✓ Example:

- **Account\_vod\_\_c** VMOC determines which Account records (HCPs) get downloaded to the iPad.
- You can set filters like:
  - **Country = India**
  - **Territory = Bangalore East**

➡ This ensures reps only see **relevant data**, not entire database.

## 3. Page Layout Configuration

iRep uses **record types + page layouts** like standard Salesforce but has iPad-optimized layouts.

### ✓ Example:

- You configure a **Call Report layout** to show:
  - HCP Name
  - Products Detailed
  - Samples Dropped
  - Signature Section

These are done using **Page Layouts** in Salesforce → Assign them to profiles.

## 4. Call Channel Configuration

This determines which **interaction types** are available in iRep.

### ✓ Example:

You configure the following **Call Channels**:

- Face-to-Face
- Remote Call
- Phone Call

These show up as a **dropdown** when creating a Call Report.

## 5. CLM Presentation Configuration

Veeva CLM (Closed Loop Marketing) is used to show **digital content (PDFs, videos, presentations)**.

To configure CLM:

- Upload content via **Vault or CRM Media Tab**
- Link to **CLM\_Presentation\_vod\_\_c** object
- Assign to Products & Territories
- Make it available on iPad via sync

## 6. Signature Capture Settings

Enable digital signature and determine:

- Which products require it
- Where it shows in call report
- How it syncs back to Salesforce

## 7. Offline Configuration

All the following need offline capability settings:

| Feature      | Setting                              |
|--------------|--------------------------------------|
| Call Entry   | <b>Enable_Offline_Call_Entry_vod</b> |
| Sample Drop  | VMOCs + Sample Transactions config   |
| CLM          | Preload presentations to iPad        |
| Account Data | Use VMOC filters to control download |

## Real-Life Scenario

 You are configuring iRep for a new product launch in Bangalore:

1. You update **Veeva\_Settings\_vod**:

- Enable CLM
- Enable Signature

2. Configure VMOCs:
  - Only HCPs in **Territory = Bangalore South**
3. Set up Call Channel values:
  - Add "Remote Call"
4. Upload new product presentation to CLM
5. Push data using **multichannel sync** to reps' iPads

## Admin Use Cases

| Task                            | Description             |
|---------------------------------|-------------------------|
| Control what HCPs a rep can see | VMOC filters            |
| Push new product presentations  | CLM Config              |
| Modify layout of Call Report    | Page Layout Assignments |
| Enable digital signature        | Veeva Settings          |

## Objects You'll Work With

| Object Name               | Purpose             |
|---------------------------|---------------------|
| Veeva_Settings_vod__c     | Feature toggles     |
| VMOC_vod__c               | Sync control        |
| CLM_Presentation_vod__c   | Digital content     |
| Call2_vod__c              | Call reports        |
| Account_vod__c            | HCPs/HCOs           |
| Sample_Transaction_vod__c | Sample drop records |

Would you like:

- A **practice iRep setup checklist**?
- A **sample VMOC configuration**?

DCR configuration with examples

Here's a detailed explanation of **DCR (Data Change Request) Configuration in Veeva CRM** with examples, components, and how it works — perfect for beginners and administrators.

## What is DCR in Veeva CRM?

**DCR** stands for **Data Change Request**. It allows **field reps (e.g., medical reps)** to request changes to **Account data** (like HCP name, address, specialty, affiliations) from **iRep or Online CRM**, and route those changes for **approval** before applying them to the master data.

## Why Use DCR?

- Ensures **data quality and compliance**
- Supports **centralized review and approval** of account changes
- Helps manage **sensitive healthcare data** securely
- Aligns with **Master Data Management (MDM)** processes

## How DCR Works (End-to-End Flow)

vbnet

Field Rep (iRep) → Submits change → DCR created → Approved **by** MDM team → Data updated **in** Account → Synced **to** rep

## Key Configuration Components

| Component                                       | Purpose                               |
|-------------------------------------------------|---------------------------------------|
| <b>Data_Change_Request_vod__c</b>               | Main object holding the request       |
| <b>DCR_Field_vod__c</b>                         | Tracks individual field changes       |
| <b>DCR_Process_vod__c</b>                       | Defines how DCR is submitted/approved |
| <b>DCR Rules</b>                                | Defines which fields are editable     |
| <b>My Accounts</b>                              | DCR is usually launched from here     |
| <b>DCR Status (Pending, Approved, Rejected)</b> | Controls visibility and sync          |

## Real-Life Scenario

### Scenario:

A field rep notices that **Dr. Ramesh's specialty is outdated** on iRep. It shows **"Cardiology"**, but he has now shifted to **"Internal Medicine"**.

### Steps:

1. The rep **opens My Accounts** on iRep.
2. Taps **Edit** → Changes **Specialty to "Internal Medicine"**
3. Hits **Submit** — a **DCR record is created**.
4. The MDM (Data Steward) receives a task in Salesforce.

5. They **review and approve** it.
6. Dr. Ramesh's record is updated.
7. Change is synced back to iRep and available to all users.

## Who Can Approve?

- Internal **Data Stewards** or **Admin team**
- Via **workflow, manual approval**, or **integrated with third-party MDM system** (like Veeva Network)

## DCR Field Control

You can define **which fields** are editable via DCR using the following:

- **DCR\_Editable\_vod\_\_c** field on objects like Account, Address, etc.
- Example:
  - Specialty → Editable by rep (TRUE)
  - License Number → Not editable (FALSE)

## Example Use Cases

| Field        | Change Example                | Impact                              |
|--------------|-------------------------------|-------------------------------------|
| Address      | Update HCP's clinic location  | Ensures reps go to the correct site |
| Phone Number | Add new mobile number         | Enables digital contact             |
| Affiliation  | Add new HCO                   | Shows updated influence map         |
| Specialty    | Change from Pediatrics to ENT | Corrects targeting & sampling       |

## Statuses of a DCR

| Status    | Meaning                    |
|-----------|----------------------------|
| Draft     | Being filled out by rep    |
| Submitted | Sent for approval          |
| Approved  | Will be applied to Account |
| Rejected  | Changes denied             |
| Cancelled | Withdrawn by rep           |

## Related Objects

| Object                         | Description                     |
|--------------------------------|---------------------------------|
| Data_Change_Request_vod__c     | Main DCR record                 |
| DCR_Field_vod__c               | Each field requested for update |
| DCR_Process_vod__c             | Rules and routing               |
| Address_vod__c, Account_vod__c | Target objects being changed    |

## Basic Setup Steps (Admin View)

1. **Enable DCR feature** via `Veeva_Settings_vod`
2. **Create DCR Process** records for each object (Account, Address, etc.)
3. Set `DCR_Editable_vod__c = TRUE` for desired fields
4. Build **approval workflows** or **assign tasks**
5. Add **"Submit DCR" button** to layouts
6. Test via **sandbox iRep/iPad**

## iRep DCR UI Example

- Field rep opens **My Accounts**
- Taps on a record → taps "Edit"
- Editable fields appear (based on DCR settings)
- Submits changes → Shows "Submitted for Approval"

## Integration with Veeva Network (Optional)

- DCRs can sync to **Veeva Network** (Master Data system)
- Network Data Stewards approve/merge data
- Changes flow back to CRM

## Summary

| Feature         | Description                                     |
|-----------------|-------------------------------------------------|
| DCR             | Request to change Account or Address info       |
| Used by         | Field reps from iRep / Web                      |
| Reviewed by     | MDM / Data Stewards                             |
| Config Includes | Editable Fields, Approval Rules, DCR Process    |
| Benefits        | Data integrity, compliance, centralized control |

Would you like:

Territory management in detail with examples

Sure! Here's a **detailed explanation of Territory Management in Veeva CRM** with real-life **examples, scenarios, and configuration details** to help you understand the concept end-to-end.

## ✓ What is Territory Management in Veeva CRM?

**Territory Management** defines which **accounts (HCPs, HCOs)** are assigned to which **field reps** based on factors like:

- **Geography**
- **Specialty**
- **Product Line**
- **Account Type**
- **Affiliations**

It ensures that:

- The **right rep** engages with the **right healthcare provider (HCP)**.
- Activities like **Call Reporting, Sampling, CLM, and Approved Emails** are compliant and limited to assigned territories.

## Why is it important?

- Helps **organize field teams** based on strategic segments.
- Prevents **unauthorized access** to HCP data.
- Enables **compliant sampling and targeting**.
- Supports **Multichannel Cycle Plans (MCCP)** and **Call Objectives**.

## Example Scenario

### ♦ Organization:

A pharmaceutical company has three territories in Karnataka:

| Territory | Region    | Speciality Focus      | Field Rep     |
|-----------|-----------|-----------------------|---------------|
| T001      | Bangalore | Cardiologists         | John (Rep A)  |
| T002      | Mysore    | General Practitioners | Sarah (Rep B) |
| T003      | Mangalore | Dermatologists        | Raj (Rep C)   |

### ◆ Accounts:

- Dr. Meera (Cardiologist in Bangalore)
- Dr. Ravi (GP in Mysore)
- Dr. Leena (Dermatologist in Mangalore)

### 🔧 System Behavior:

- **Rep A** (T001) can access and submit **calls, samples, and emails** to Dr. Meera only.
- **Rep B** (T002) cannot see Dr. Meera's record.
- **Rep C** (T003) will only access Dr. Leena's record.

## 🔧 Configuration in Veeva (via Salesforce)

### ✓ 1. Define Territories

- Use **Territory2** model (standard Salesforce feature).
- Territories are structured hierarchically (e.g., Country > State > City).

```
plaintext
```

```
India > Karnataka > Bangalore (T001)
```

### ✓ 2. Assign Users to Territories

- Map field reps to their respective territories using **UserTerritory2Association** object.

```
plaintext
```

```
Rep A → Bangalore  
Rep B → Mysore
```

### ✓ 3. Assign Accounts to Territories

- Use **rules or manual assignment** to link HCPs to appropriate territories using:
  - Geography (zip code, city)
  - Specialty
  - Product Affiliation

```
plaintext
```

```
Dr. Meera → Assigned to T001
Dr. Ravi → Assigned to T002
```

This mapping is stored in the **AccountTerritoryAssignmentRule** object or via **Align integration**.

#### ✓ 4. Use Sharing Rules to Grant Access

- Sharing rules allow access to Accounts in the same Territory.
- Each Territory gives access only to assigned users.

### → Territory-Based Features in Veeva

| Feature                | Impact of Territory                                     |
|------------------------|---------------------------------------------------------|
| Call Reporting         | Rep can only log calls for HCPs in assigned territory   |
| Sampling               | Samples can only be dropped to HCPs assigned to the rep |
| CLM Presentations      | Triggered only for eligible HCPs                        |
| MCCP / Call Objectives | Only show accounts in the territory                     |
| Approved Email         | Email targets limited to assigned HCPs                  |

### 🔪 Advanced Example

#### Scenario:

A new product launch requires **Cardiologists in Bangalore** and **Neurologists in Chennai** to be targeted. You configure two **Product-Based Territories**:

- **Cardio\_BLR\_Territory** → Cardiologists in Bangalore
- **Neuro\_CHN\_Territory** → Neurologists in Chennai

Reps are assigned based on **specialty AND product access**.

### 🧠 Key Objects Involved (Technical)

| Object                             | Purpose                                   |
|------------------------------------|-------------------------------------------|
| Territory2                         | Defines the territory                     |
| UserTerritory2Association          | Maps user (rep) to territory              |
| Account                            | HCP or HCO record                         |
| AccountTerritoryAssignmentRuleItem | Logic to assign accounts                  |
| Call2_vod__c                       | Call reports filtered by territory access |

## ✓ Summary

| Topic             | Key Point                                  |
|-------------------|--------------------------------------------|
| Purpose           | Organizes account access for reps          |
| How               | Based on geography, specialty, etc.        |
| Benefits          | Ensures compliance, targeting, and control |
| Tools Used        | Territory2, Account mapping, Veeva Align   |
| Impacted Features | Call Reporting, Sampling, MCCP, Email      |

Would you like:

- A **step-by-step Salesforce setup guide for Territory Management?**
- Or a **Veeva Align integration explanation** for bulk territory updates?

A step-by-step Salesforce setup guide for Territory Management

Here's a **step-by-step Salesforce setup guide** to configure **Territory Management** for use with **Veeva CRM**. This guide walks you through the **Territory2 model**, which is the foundation for Veeva territory assignments.

## 🚀 Step-by-Step: Territory Management Setup in Salesforce (for Veeva CRM)

### ✓ Step 1: Enable Enterprise Territory Management (ETM)

1. Go to **Setup**.
2. In the **Quick Find box**, search for **Territory Settings**.
3. Click **Territory Settings**.
4. Click **Enable Enterprise Territory Management**.
5. Click **Save**.

⚠ You can't disable this once enabled.

### ✓ Step 2: Create a Territory Model

1. Go to **Setup** → **Territory Models**.
2. Click **New Territory Model**.
3. Enter:

- **Model Name:** India\_Model\_2025
- **Description:** Territory model for Indian field force 2025

4. Click **Save**.

i This model is created in **Planning** status first (not active).

## ✓ Step 3: Define a Territory Hierarchy

1. Go to your model → Click **View Hierarchy**.
2. Click **Add Territory**.
3. Name your base territory:
  - **Territory Name:** India
  - **Territory Type:** Create a new one if needed (**Country Level**)
4. Click **Add Territory** to create child nodes:
  - Karnataka
  - Tamil Nadu
  - Maharashtra

You can keep adding granular sub-territories like **Bangalore**, **Chennai**, etc.

## ✓ Step 4: Create Territory Types (Optional)

- Go to **Setup** → **Territory Types**.
- Define types like:
  - National
  - Regional
  - Area
  - Product-Based

## ✓ Step 5: Assign Users (Field Reps) to Territories

1. Go to **Territory Hierarchy**.
2. Click a territory (e.g., **Bangalore**).
3. Go to **Assigned Users** tab.
4. Click **Assign Users**.
5. Select the reps you want (e.g., **John Rep**, **Sarah Rep**) and assign.

✓ This links users via the **UserTerritory2Association** object.

## Step 6: Define Assignment Rules for Accounts (HCPs)

You can **automatically assign Accounts (HCPs)** to territories based on rules.

### Option A: Manual Assignment

- Navigate to an Account → Territory Assignments → Add manually.

### Option B: Rule-Based Assignment

1. In your Territory Model, go to **Assignment Rules**.
2. Click **Create Rule**.
3. Example Rule: Assign **Accounts in Bangalore** to **Bangalore Territory**
  - Criteria: `BillingCity = 'Bangalore' AND Specialty__c = 'Cardiologist'`
4. Save and **Run Rule**.

 The result is stored in `AccountTerritoryAssignmentRuleItem`.

## Step 7: Publish the Territory Model

1. Go to **Territory Models**.
2. Select your model → Click **Activate**.
3. It becomes your **Active Model**, used for real-time territory access.

## Step 8: Sync with Veeva CRM (via Veeva Align or Manual Data Loads)

- Push the final **user-territory-account** mapping into Veeva CRM.
- This ensures reps see only the assigned HCPs, schedule calls, and perform sampling correctly.

 For large organizations, use **Veeva Align** to automate territory planning, assignment, and deployment.

## Real-World Example

| Rep Name | Territory | Assigned Accounts (HCPs)           |
|----------|-----------|------------------------------------|
| John     | Bangalore | Dr. Meera (Cardiologist), Dr. Hari |
| Sarah    | Mysore    | Dr. Ravi (General Practitioner)    |
| Raj      | Chennai   | Dr. Leena (Dermatologist)          |

Each rep can:

- View only the assigned accounts.

- Submit call reports only for those HCPs.
- Drop samples or send emails only to those in their territory.

## Bonus: Control Access via Sharing Rules

Salesforce automatically sets **record-level sharing** using the Territory Model:

- Users assigned to a territory automatically get **Read/Write access** to related Accounts.

You can fine-tune access for:

- Managers (share across multiple child territories)
- MSLs (read-only)
- Support Staff (view-only access)

## Summary

| Step | Action                          |
|------|---------------------------------|
| 1    | Enable ETM                      |
| 2    | Create Model                    |
| 3    | Build Territory Hierarchy       |
| 4    | Assign Users                    |
| 5    | Define Account Assignment Rules |
| 6    | Publish Model                   |
| 7    | Sync with Veeva                 |
| 8    | Apply Sharing Rules (if needed) |

Would you like:

- A **downloadable Salesforce configuration deck (PPT or PDF)?**
- Or a **guide for doing this with Veeva Align integration?**

Veeva Align integration explanation for bulk territory updates

Here's a detailed explanation of how **Veeva Align integrates with Veeva CRM and Salesforce** to perform **bulk territory updates**, with real-world examples and technical flow:

## What is Veeva Align?

**Veeva Align** is a cloud-based **territory alignment and planning tool** used by life sciences companies. It helps manage:

- Territory models
- HCP-HCO assignments
- Field rep assignments
- Product access
- Channel eligibility (Email, Sampling, etc.)

It integrates directly with **Veeva CRM** to **push alignment data in bulk** — meaning reps get updated HCP lists, call plans, and channel access **automatically**.

## Why Use Veeva Align for Bulk Updates?

Manual updates via Data Loader or Admin Console are:

- Time-consuming
- Error-prone
- Hard to audit

Veeva Align lets you:

- Model complex rules (e.g., “Only Cardiologists in Bangalore get assigned to Rep A”)
- Simulate before deploying
- Push **bulk assignments** via automated **deployment plans**

## How Integration Works (High-Level Flow)

```

text

Veeva Align (Planning UI)
    ↓
Territory & Assignment Rules
    ↓
Deploy Plan → Align Deployment Engine
    ↓
Veeva CRM (AccountTerritory__c, UserTerritory__c updates)
  
```

## Key Objects Synced Between Align and CRM

| Align Object              | Pushed to CRM as          |
|---------------------------|---------------------------|
| Territory__aln            | Territory2                |
| Territory_Assignment__aln | AccountTerritory__c       |
| User_Assignment__aln      | UserTerritory2Association |

| Align Object        | Pushed to CRM as               |
|---------------------|--------------------------------|
| Channel_Rule__aln   | Approved Email / Sample access |
| Product_Access__aln | CRM Product Visibility         |

## Step-by-Step Example: Bulk Update via Veeva Align

### Use Case:

Marketing wants to realign the field force. All **Cardiologists in Mumbai** should now be assigned to **Rep Neha**, and **Sample access** should be revoked for **Dr. Asha**.

### Step 1: Data Prep in Align

- **Accounts Data (HCPs):**
  - Pull updated HCP list from CRM (e.g., via Connect)
  - Segment by specialty, geography
- **Users Data (Field Reps):**
  - Import rep list with roles, territory eligibility

### Step 2: Define Territories & Assignment Rules

- Create **Territory Object**: Mumbai\_Cardiology
- Define **Assignment Rule**:
  - If City = Mumbai AND Specialty = Cardiologist → Assign to Mumbai\_Cardiology
- Define **User Assignment Rule**:
  - Rep Neha → Assigned to Mumbai\_Cardiology
- Define **Channel Rules**:
  - If HCP = Dr. Asha → Disable Sample\_Access\_\_aln = false

### Step 3: Create a Deployment Plan

- **Deployment Plan Name**: Q3\_Realignment\_Mumbai
- Target Model: India\_Model\_2025
- Contents:
  - New Territories
  - Updated HCP Assignments
  - Revoked Sample Access

 Deployment Plans are **version-controlled** and **previewable** before pushing.

## ✓ Step 4: Simulate Deployment

- Click “Run Simulation”
- Review:
  - HCPs added/removed
  - Rep-HCP mappings
  - Access changes

✓ Helps validate logic before impact.

## ✓ Step 5: Execute Deployment

- Click “Deploy to CRM”
- Align pushes updates via:
  - Integration Layer (Vault → CRM Connect)
  - Or via scheduled jobs / API (optional)

⌚ Sync runs typically within a few minutes to an hour.

## ✓ Step 6: Confirm Changes in CRM

Check in Veeva CRM:

- AccountTerritory\_\_c → HCP assigned to Neha
- UserTerritory2Association → Neha assigned to Mumbai\_Cardiology
- call2\_vod object shows Dr. Asha unavailable for samples

## 🛡️ Security & Audit

- Align maintains **audit trails** of who deployed what, when.
- Full visibility on **field change history** (Product Access, Territory, Channel)

## ✓ Summary Table

| Task                          | Without Align             | With Align            |
|-------------------------------|---------------------------|-----------------------|
| Assign reps to territories    | Manual Excel upload       | Rule-based automation |
| Update HCP access             | Admin Console/Data Loader | Deployment plans      |
| Track changes                 | Difficult                 | Built-in audit trail  |
| Time to update 1,000+ records | Hours                     | Minutes               |

## Want More?

reports and dashboards

Here's a detailed yet easy-to-understand explanation of **Reports and Dashboards in Veeva CRM** (Salesforce-based), including **key components**, **real-life examples**, and **best practices** for life sciences field operations.

## What Are Reports & Dashboards in Veeva CRM?

- **Reports:** A structured way to retrieve, filter, and display your CRM data (e.g., HCP calls, samples delivered, CLM usage).
- **Dashboards:** Visual representations of multiple reports using charts, graphs, and metrics — designed for quick decision-making.

Both are built on top of Salesforce's native **reporting engine**, customized for Veeva data objects like `Call2_vod`, `Account`, `Sample_Transaction_vod`, `CLM_Presentation_vod`, etc.

## Key Veeva Objects Commonly Used in Reports

| Veeva Object                           | Description                 |
|----------------------------------------|-----------------------------|
| <code>Call2_vod__c</code>              | HCP visit record            |
| <code>Account</code>                   | HCP or HCO profile          |
| <code>Sample_Transaction_vod__c</code> | Records of samples given    |
| <code>CLM_Presentation_vod__c</code>   | Closed Loop Marketing usage |
| <code>Multichannel_Activity_vod</code> | Emails, remote calls, etc.  |
| <code>User</code>                      | Sales reps or managers      |

## Example Reports (Real Use Cases)

### ◆ 1. Call Activity Report

**Goal:** Track how many HCP visits were completed this month by each rep.

- **Report Type:** Calls with Accounts
- **Filters:**
  - Call Date = THIS MONTH
  - Call Status = Submitted
- **Group By:** Rep Name
- **Columns:** HCP Name, Date, Products Discussed

#### Use in Dashboard:

- Bar chart: "Calls per Rep"
- Pie chart: "Call Status Breakdown"

## ◆ 2. Sample Compliance Report

**Goal:** Ensure reps are not exceeding sample limits or violating restrictions.

- **Report Type:** Sample Transactions
- **Filters:**
  - Date = LAST 30 DAYS
  - Controlled Substance = TRUE
- **Group By:** Rep, HCP
- **Add Field:** Signature Captured = TRUE/FALSE

#### Use in Dashboard:

- Table: Top 10 reps with most controlled samples
- KPI: # of missing signatures

## ◆ 3. CLM Usage Report

**Goal:** Monitor how many digital presentations are used by reps and which messages are most effective.

- **Report Type:** CLM Presentations with Calls
- **Filters:** Date = THIS QUARTER
- **Group By:** Product → Message
- **Metrics:** # Views, Duration (Seconds), Rep

#### Use in Dashboard:

- Bar graph: Top 5 CLM Messages
- Heat map: Usage by Region

## ◆ 4. Account Segmentation Report

**Goal:** Group HCPs by specialty, activity level, or product interest.

- **Report Type:** Accounts
- **Filters:**
  - Segment = "High Value"
  - Call Frequency = < 2 per month
- **Columns:** HCP Name, Specialty, Region

 **Action:** Sales Managers use this to **reprioritize territory planning**.

## Types of Reports

| Type           | Use Case Example                                      |
|----------------|-------------------------------------------------------|
| <b>Tabular</b> | Simple list (e.g., List of HCPs)                      |
| <b>Summary</b> | Group by fields (e.g., Calls per Rep)                 |
| <b>Matrix</b>  | Pivot-table style (e.g., Product vs Rep)              |
| <b>Joined</b>  | Combine multiple objects (e.g., HCP with CLM + Calls) |

## Dashboards: Layout and Components

| Component  | Use For                                    |
|------------|--------------------------------------------|
| Bar Chart  | Compare reps, products, HCPs               |
| Line Chart | Trends over time (monthly/quarterly calls) |
| KPI Metric | # of HCP calls made this week              |
| Pie Chart  | Sample types used across regions           |
| Table      | Detailed top 10 records                    |

 **Dashboard Tip:**

- Keep it **role-specific**:
  - Field Rep → See personal call targets
  - Manager → Team overview + goal attainment

## Permissions & Access

- Controlled via **Report Folder Sharing** (Public, Manager-only, Role-based).
- Reps can only see their own data unless explicitly allowed via sharing rules.

## Best Practices

| Tip                    | Why                                                                          |
|------------------------|------------------------------------------------------------------------------|
| Use filters smartly    | Prevents overload and makes reports relevant                                 |
| Schedule reports       | Auto-send weekly reports to managers/ reps                                   |
| Use dynamic dashboards | Let each user see their own data with 1 dashboard                            |
| Clean data             | Ensure fields like <b>Specialty</b> , <b>Call Status</b> are properly filled |

## Automation and Advanced Use

- Use **Scheduled Dashboards** to send email digests weekly/monthly.
- Use **Veeva CRM MyInsights** for interactive dashboards embedded in iRep.
- Leverage **report API** to pull reports into third-party tools (Tableau, Power BI).

## Summary

| Feature           | Purpose                               | Example                      |
|-------------------|---------------------------------------|------------------------------|
| <b>Report</b>     | Slice/filter data                     | List of calls this month     |
| <b>Dashboard</b>  | Visual insights from multiple reports | Bar chart: Calls per product |
| <b>MyInsights</b> | Embedded, interactive data view       | iPad call goal tracker       |

Would you like:

- A **step-by-step guide** to create a dashboard?
- Or a use-case-specific report walkthrough (e.g., Sampling compliance)?

Let me know and I'll provide exactly what you need.

coaching report

## Veeva CRM Coaching Report – Detailed Explanation with Examples

In **Veeva CRM**, a **Coaching Report** is a specialized tool used by **managers or trainers** to evaluate and coach field reps (e.g., Medical Representatives or Sales Reps) based on their performance, interactions, and compliance during HCP (Health Care Professional) visits or product presentations.

## What is a Coaching Report in Veeva CRM?

A **Coaching Report** is a structured digital form in Veeva CRM used by field managers to:

- Observe rep behavior (e.g., communication skills, adherence to messaging),

- Provide real-time or post-call feedback,
- Track progress over time,
- Ensure regulatory and brand compliance.

It's typically linked to **Call Reports** or **CLM Presentations** and stored as a record for each coaching session.

## Real-Life Scenario Example

### Example 1: Field Ride-Along

 A manager accompanies Rep John on a visit to Dr. Smith.

- After the call, the manager opens the **Coaching Report** object in the iRep iPad app.
- They rate John on:
  - Product knowledge
  - Message delivery
  - Engagement of the HCP
  - Use of approved CLM content
- Comments are added: *"Excellent engagement, but needs to focus more on objection handling."*
- Action Plan: *"Review objection handling module and schedule follow-up coaching in 2 weeks."*

✓ This record becomes part of John's performance record and can be pulled into dashboards for coaching effectiveness.

## Key Fields in a Coaching Report (Customizable)

| Field Name          | Description                                      |
|---------------------|--------------------------------------------------|
| Coach Name          | Manager who performed the coaching               |
| Coached Rep         | Field rep being evaluated                        |
| Call Reference      | Link to the specific HCP call                    |
| Date of Coaching    | When the coaching took place                     |
| Skills Rating (1-5) | Product knowledge, Messaging, Objection Handling |
| Compliance Checks   | Was the call compliant? (Y/N)                    |
| Observations        | Free text notes                                  |
| Development Plan    | Suggested next steps                             |
| Follow-up Required? | Checkbox or Yes/No                               |
| Follow-up Date      | For scheduling future review                     |

## Use in Reports and Dashboards

Managers and HR teams can analyze coaching trends:

| Example Report                   | Purpose                                      |
|----------------------------------|----------------------------------------------|
| Coaching Frequency per Rep       | Ensure all reps are being coached fairly     |
| Average Skills Rating per Region | Spot training needs in underperforming teams |
| Follow-up Completion Status      | Ensure coaching loops are closed             |
| Compliance Coaching Dashboard    | Link coaching with sample compliance metrics |

## Integration with Other Veeva Modules

| Module               | How It Connects to Coaching Reports           |
|----------------------|-----------------------------------------------|
| Call Reporting       | Coaching can be done post-call                |
| CLM Usage            | Coach can review how rep used eDetail aid     |
| Sample Management    | Can coach based on sample handling practices  |
| Territory Management | Analyze if reps are following territory plans |
| Approved Email       | Coach email usage quality                     |

## Configuration Basics (Admin View)

1. **Enable the Coaching\_Report\_vod\_\_c Object**
2. Define **Record Types**:
  - Ride-Along
  - Remote Call Coaching
3. Add Custom Fields:
  - Rating scales (picklist or number)
  - Text area for observation
4. **Create Page Layouts** based on roles (Field Manager, Trainer)
5. Set **Profile Permissions** for reps and managers
6. Use **Workflow Rules**:
  - Send reminders for follow-up
  - Auto-close coaching loops
7. Add to **MyInsights** Dashboard for rep-level and team-level views

## Best Practices

| Tip                                     | Why it Helps                  |
|-----------------------------------------|-------------------------------|
| Link to specific calls or presentations | Adds context and precision    |
| Keep feedback actionable                | Helps reps grow from coaching |

| Tip                                 | Why it Helps                           |
|-------------------------------------|----------------------------------------|
| Track follow-ups                    | Ensures accountability and improvement |
| Use standard rating scales          | Enables comparison across reps         |
| Make it mobile-friendly (iRep/iPad) | Boosts field adoption                  |

## Summary

| Feature            | Purpose                                         |
|--------------------|-------------------------------------------------|
| Coaching Report    | Evaluate and guide rep behavior                 |
| Real-time Feedback | Improve call quality and brand alignment        |
| Linked to CRM Data | Context-rich coaching tied to actual activities |
| Reporting & Trends | Drive training and performance improvement      |

Would you like a **sample template** of a Coaching Report layout or a **guide to creating one in Salesforce Setup**? I can generate that for you!

A step-by-step guide to create a dashboard?

Here's a **step-by-step guide to create a Dashboard in Veeva CRM (Salesforce platform)**. Dashboards in Veeva allow users—especially Managers, Sales Ops, and Admins—to **visualize key data** like HCP call activities, coaching trends, product detailing, territory performance, etc.

## Part 1: Prerequisites

-  Ensure you have:
  - Access to **Reports & Dashboards tab**
  - A created **report** (Dashboards are based on reports)
  - Necessary **permissions**: “Run Reports” and “Manage Dashboards”
-  Recommended objects (example reports):
  - **Call2\_vod\_\_c** – Call Reporting
  - **Account** – HCPs/HCOs
  - **Coaching\_Report\_vod\_\_c**
  - **CLM\_Presentation\_vod\_\_c**

## Part 2: Creating the Source Report

### Step 1: Navigate to Reports Tab

- Click **New Report**
- Select a report type (e.g., **Calls with Account**)

## Step 2: Add Filters

- Example:
  - **Date** = "Last 30 Days"
  - **Territory** = "East Region"
  - **Call Status** = "Submitted"

## Step 3: Add Groupings

- Group by: **User, Account, or Product\_Detailed\_\_c**
- Add summary fields like: **Count of Calls, Average Duration**

## Step 4: Save the Report

- Give it a name like: **Monthly Call Activity by Rep**
- Folder: Save in a public or personal folder

# Part 3: Creating the Dashboard

## Step 1: Go to Dashboards Tab

- Click **New Dashboard**

## Step 2: Set Basic Info

- **Name:** "Field Activity Tracker"
- **Folder:** Choose where others can access it
- **View Dashboard As:** Choose:
  - "The dashboard viewer" – dynamic based on user
  - Or a specific user (e.g., Regional Manager)

## Step 3: Add Components (Charts/Graphs)

For each component:

1. Click **+Component**
2. Select a report (e.g., "Monthly Call Activity by Rep")
3. Choose a **Chart Type**:
  - Bar Chart → For comparing call counts by rep
  - Pie Chart → For % share of product presentations

- Line Graph → For coaching trend over time
- Gauge → To measure target vs actual calls

#### 4. Set Labels:

- Title: "Calls per Rep"
- Subtitle: "Last 30 Days"

#### 5. Click **Add**

Repeat to add multiple components like:

- Coaching Reports Follow-up Status
- Product Detailing Trends
- Sample Distribution Compliance
- Email Open Rates (Approved Email)

## Step 4: Adjust Layout

- Drag components to arrange them
- Resize them for visibility

## Step 5: Save and Run Dashboard

- Click **Save & Run**
- The dashboard now visualizes live data

## Optional Enhancements

| Feature                  | Benefit                                      |
|--------------------------|----------------------------------------------|
| Scheduled Refresh        | Auto-refresh the dashboard (e.g., every day) |
| Filters                  | Add dashboard-level filters like Date/Region |
| Mobile Compatible (iRep) | View dashboards on iPad                      |
| Embed in MyInsights      | Show inside the iRep or online portal        |

## Example Use Case: Coaching Effectiveness Dashboard

| Component Title             | Data Source                     | Visualization |
|-----------------------------|---------------------------------|---------------|
| Coaching Reports This Month | Coaching_Report_vod             | Line Chart    |
| Avg Rating per Skill        | Coaching_Report_vod (grouped)   | Bar Chart     |
| Follow-up Completion %      | Coaching_Report_vod             | Gauge         |
| Calls with Coaching         | Call2_vod + Coaching_Report_vod | Pie Chart     |

Would you like a downloadable **dashboard template** or a **step-by-step screenshot walkthrough (PDF/PPT)** as well?

Coaching Report layout guide to creating one in Salesforce Setup

Here's a complete **step-by-step guide to creating a Coaching Report layout in Salesforce Setup** for Veeva CRM. This setup helps managers evaluate and coach field reps after HCP visits or CLM presentations.

## What You'll Be Setting Up

You'll configure the `Coaching_Report_vod__c` object in Salesforce:

- Add fields (ratings, comments, etc.)
- Create a layout
- Assign it to user profiles (Managers)
- Optionally automate follow-ups and reporting

## Step-by-Step: Creating a Coaching Report Layout

### 1. Navigate to Object Manager

- Go to **Setup** →  search for **Object Manager**
- Search for: `Coaching_Report_vod__c`

*(This is a Veeva object. If it doesn't exist, you need Veeva CRM installed.)*

### 2. Add Custom Fields

Click on **Fields & Relationships** → **New**

**Example Custom Fields to Add:**

| Field Label         | Type           | Purpose                               |
|---------------------|----------------|---------------------------------------|
| Product Knowledge   | Picklist (1–5) | Rate rep's product knowledge          |
| Messaging Accuracy  | Picklist (1–5) | Rate accuracy of brand messaging      |
| Objection Handling  | Picklist (1–5) | Rate rep's handling of HCP objections |
| Manager Comments    | Long Text      | Freeform feedback from the manager    |
| Follow-up Required? | Checkbox       | Whether a follow-up session is needed |
| Follow-up Date      | Date           | Schedule future coaching              |
| Linked Call         | Lookup(Call2)  | Link this report to a Call report     |
| Rep Being Coached   | Lookup(User)   | Link to the rep coached               |

Save each field and **add to the appropriate Page Layout**.

---

### ✓ 3. Create/Customize Page Layout

- Under **Page Layouts**, edit or create a layout (e.g., **Standard Coaching Layout**)

**Drag and organize fields into logical sections:**

**Suggested Sections:**

- **Coaching Overview**
  - Coaching Date (auto)
  - Linked Call
  - Rep Being Coached
  - Territory
- **Evaluation**
  - Product Knowledge
  - Messaging Accuracy
  - Objection Handling
- **Feedback**
  - Manager Comments
  - Follow-up Required
  - Follow-up Date
- **Status**
  - Coaching Status (Draft, Completed)
  - Next Coaching Session Date

🔥 **Tip:** Use **required fields**, and set defaults (e.g., “Draft” for status)

---

### ✓ 4. Set Layout Assignment to Profiles

Go to **Page Layout Assignment** → Assign your new layout to:

- **Field Managers**
  - **District Managers**
  - Optionally Admin profiles for testing
- 

### ✓ 5. Create Record Types (Optional but Recommended)

Record Types allow you to have different layouts or processes for:

- **Ride-Along Coaching**

- **Virtual Coaching**
- **Post-Call Coaching**

Steps:

- In the same object, click **Record Types**
- Click **New**
  - Name: **Ride-Along Coaching**
  - Assign your layout
  - Set picklist values accordingly (e.g., coaching type)

## ✓ 6. Permissions

Ensure that:

- Managers have **Read/Create/Edit** access on **Coaching\_Report\_vod\_\_c**
- Reps have **Read-Only** access (if needed)
- Ensure profiles can see the new custom fields

Use **Permission Sets** if you're managing roles flexibly.

## ✓ 7. Automation (Optional Enhancements)

- **Workflow Rule / Flow:** If **Follow-up Required** = True, send a reminder email before **Follow-up Date**
- **Validation Rule:** Require a comment if rating is below 3
- **Report and Dashboard:** Track coaching frequency, trends, follow-up status

## Bonus: Make it Work on iRep (iPad)

- Ensure the layout is **mobile-optimized** (group fields tightly)
- Enable the Coaching object tab in the **Veeva iRep navigation bar**
- Test by logging in as a manager profile on iPad (or iPad emulator)

## ✓ Example Layout View (Visual)

markdown

```
-----
| Coaching Report: Ride-Along - 23 Jul 2025 |
-----
| Rep: John Smith          Call: #C-883737 |
| Date: 23 Jul 2025       Territory: East  |

Survey Management in detail with examples

Sure! Here's a **detailed explanation of Survey Management in Veeva CRM**, including **real-world examples** and **step-by-step breakdowns**.

## What Is Survey Management in Veeva CRM?

**Survey Management** is a feature in Veeva CRM that enables field reps and other users to:

- Create, assign, and distribute surveys to **Health Care Providers (HCPs)**,
- Capture structured feedback or data,
- Analyze responses for strategic decisions.

Surveys are especially useful for **market research**, **product feedback**, **event evaluations**, and **post-call follow-ups**.

## Key Components of Survey Management

| Component              | Description                                                    |
|------------------------|----------------------------------------------------------------|
| Survey_vod__c          | The main object that defines the survey (title, status, type). |
| Survey_Question_vod__c | Defines individual questions linked to a survey.               |
| Survey_Target_vod__c   | The HCPs/accounts to whom the survey is assigned.              |
| Survey_Response_vod__c | Stores individual responses for each target/question.          |

| Component                    | Description                                                  |
|------------------------------|--------------------------------------------------------------|
| Survey_Target_Account_vod__c | Links the Survey to an account/HCP (record of distribution). |

## Real-World Use Case Scenarios

### Example 1: Product Feedback Survey

**Objective:** After introducing a new drug, PharmaCo wants feedback from doctors on its effectiveness.

#### Setup:

- **Survey:** "New Drug Feedback – Q3"
- **Questions:**
  - How likely are you to prescribe this medication again? (1–5)
  - What side effects have your patients reported?
  - How would you rate the product's ease of use?

#### Execution:

- Field reps visit 100 HCPs.
- During or after the visit, they fill out the survey using **iRep**.
- Data is collected centrally.

#### Outcome:

- Marketing analyzes common feedback trends and prepares better collateral.

### Example 2: Post-Event Evaluation

**Objective:** Get feedback after a medical education event.

**Survey Title:** "CME 2025 Event Feedback"

#### Questions:

- Rate the quality of speakers.
- Was the content relevant to your practice?
- Would you attend another Veeva-sponsored event?

#### Distribution:

- Linked to **Event Management** module.
- Sent to all attendees via **Approved Email** or collected in-person.

### Example 3: Compliance Check Survey

**Objective:** Regulatory audit check for sample distribution practices.

## Questions:

- Did the rep explain storage instructions?
- Were samples handed directly to you?
- Was consent form provided?

Collected responses help audit compliance behaviors.

---

## How It Works (Setup Flow)

### Step 1: Create the Survey

- Go to the **Survey\_vod\_\_c** object in Salesforce.
- Fill in:
  - Survey Name
  - Description
  - Type (Field Survey, Email, etc.)
  - Status = Draft

### Step 2: Add Questions

- Go to **Survey\_Question\_vod\_\_c**
- Link to the survey
- Choose question type:
  - Text
  - Picklist
  - Number
  - Multi-select
  - Yes/No

#### Example:

- Question: "Would you recommend this product?"
- Type: Picklist (Yes, No, Maybe)

### Step 3: Define Targets

- Go to **Survey\_Target\_vod\_\_c**
- Define which reps or territories should administer the survey.

### Step 4: Assign to Accounts

- Use **Survey\_Target\_Account\_vod\_\_c** to assign the survey to HCPs.

- Can be manual or automated (via data loader, triggers, Align integration).

## Step 5: Collect Responses

- Reps access the survey via **iRep on iPad** or web.
- Complete survey during HCP visit or remotely.
- Responses are saved in **Survey\_Response\_vod\_\_c**.

## Step 6: Analyze Reports

- Create reports and dashboards:
  - Response Rate by Territory
  - Sentiment analysis
  - Common issues across regions

## Data Visibility and Security

- Surveys can be restricted based on **Territory, Profile, or User Role**.
- Responses are auditable for **compliance** and **FDA review**.
- Only approved users can edit surveys.

## Offline Support (iRep)

- Surveys are downloaded to the iPad.
- Even if no internet is available, reps can collect responses.
- Syncs back to Salesforce/Veeva CRM once online.

## Best Practices

| Tip                                     | Why it Matters                  |
|-----------------------------------------|---------------------------------|
| Preload surveys before field deployment | Ensures offline access          |
| Use standardized question formats       | Easier to report and compare    |
| Validate mandatory questions            | Avoid incomplete responses      |
| Link to Account or Call                 | Track context of response       |
| Automate follow-up tasks                | For surveys that require action |

Would you like:

- A **survey creation template (CSV or JSON)?**
- Sample **Apex automation for assigning surveys?**

- A visual **dashboard design for survey reporting?**

Let me know what part you'd like expanded or customized for your team.

Medical event in detail with multiple examples

Certainly! Here's a **detailed explanation of Medical Events** in **Veeva CRM**, along with **real-life examples, workflows, and configurations**.

## What Is a Medical Event in Veeva?

A **Medical Event** in Veeva CRM refers to any **organized interaction between healthcare professionals (HCPs)** and the pharmaceutical company, usually involving:

- Educational programs (e.g., CME)
- Advisory boards
- Speaker programs
- Webinars
- Roundtable discussions

These events are used to **share scientific information, gather expert feedback**, and ensure **regulatory compliance** when engaging HCPs.

## Purpose of Medical Events in Veeva

- Track **event planning, execution, and compliance**
- Capture **attendee details, speaker info**, and **spending limits**
- Ensure **FDA/Pharma compliance** (Sunshine Act, EFPIA, etc.)
- Integrate seamlessly with **CRM activities** (e.g., calls, surveys, emails)

## Core Objects in Medical Events Module

| Object                       | Purpose                                                          |
|------------------------------|------------------------------------------------------------------|
| <b>Medical_Event_vod__c</b>  | The main object representing the event (title, date, type, etc.) |
| <b>Event_Attendee_vod__c</b> | Links HCPs or internal users to the event                        |
| <b>Speaker_vod__c</b>        | Defines speakers for the event                                   |
| <b>Expense_vod__c</b>        | Tracks costs, honoraria, and travel                              |
| <b>Event_Material_vod__c</b> | Materials (slides, handouts) used in the event                   |
| <b>Event_Location_vod__c</b> | Specifies physical or virtual location                           |

| Object                     | Purpose                                                      |
|----------------------------|--------------------------------------------------------------|
| Event_Configuration_vod__c | Used to define rules like limits per speaker, max cost, etc. |

## Real-Life Use Cases

### Example 1: Continuing Medical Education (CME)

- **Event Name:** "New Diabetes Treatment Guidelines 2025"
- **Type:** CME Program
- **Location:** JW Marriott, New York
- **Audience:** 50 Cardiologists
- **Speaker:** Dr. Smith (paid \$1,000 honorarium)
- **Outcome:** 45 HCPs attended, feedback surveys collected, all spend tracked

### Example 2: Speaker Program (Branded)

- **Objective:** Promote new drug via peer-to-peer education
- **Event Title:** "Managing Hypertension with XDrug"
- **Attendees:** 10 General Physicians
- **Speaker:** In-house KOL (Key Opinion Leader)
- **Expense:** Venue (\$500), Meal (\$300), Speaker Fee (\$1,200)

Compliance requires:

- Attendee signatures
- Tracking of meal value per HCP
- Linking survey or call post-event

### Example 3: Virtual Advisory Board

- **Platform:** Zoom/WebEx
- **Purpose:** Get expert insights for upcoming clinical trial
- **Participants:** 8 specialists (remote login)
- **Material Shared:** Slide deck + whitepaper
- **Follow-up:** Approved Email and DCR updates

## Configuration Overview (Step-by-Step)

### 1. Enable Medical Events

- Installed as part of **Veeva Events Management**

- Configure via **Event Configuration object**
- Set:
  - Event types (CME, Webinar, etc.)
  - Max spend
  - Required fields (e.g., speaker name, sign-in)

## ✓ 2. Create Event

- Go to `Medical_Event_vod__c`
- Fill in:
  - Title
  - Type (e.g., Branded, Non-Branded, Advisory Board)
  - Date/Time
  - Budget

## ✓ 3. Add Speakers and Attendees

- Use `Speaker_vod__c` for professionals delivering the content
- Use `Event_Attendee_vod__c` to add HCPs or internal team members

## ✓ 4. Add Location or Virtual Link

- Use `Event_Location_vod__c` or set as "Virtual"
- Set seating capacity, AV needs, etc.

## ✓ 5. Upload Materials

- Attach approved presentation decks, product brochures
- Use `Event_Material_vod__c`

## ✓ 6. Capture Spend

- Record honorarium, travel, food via `Expense_vod__c`
- Set GL Codes and cost centers for finance tracking

## ✓ 7. Execute and Collect Data

- Collect eSignatures (HCP confirmation)
- Capture surveys
- Sync back to CRM post-event

---

## Compliance Features

| Feature                | How It Helps                                                         |
|------------------------|----------------------------------------------------------------------|
| Spending Limits        | Set caps on speaker fees, meal costs per HCP                         |
| eSignature Integration | Capture digital signatures to confirm participation                  |
| Transparency Reporting | Generate reports for <b>Sunshine Act</b> or <b>EFPIA</b> submissions |
| Approval Workflow      | Route events for MLR (Medical, Legal, Regulatory) approval           |
| Audit Trail            | Tracks all changes made to the event record for compliance           |

## Reporting and Analytics

You can build dashboards showing:

- Number of events per product or territory
- Total HCP attendance per quarter
- Spend per HCP or speaker
- Post-event survey results
- Compliance vs. violation trends

## iRep and Offline Use

- Medical Events can be **planned and tracked offline** using iRep
- Signature collection, attendee check-in, and surveys still work offline
- Data syncs once the device reconnects

## Best Practices

| Best Practice                          | Benefit                             |
|----------------------------------------|-------------------------------------|
| Use event templates                    | Standardizes branding, compliance   |
| Pre-approve speakers and content       | Avoids compliance delays            |
| Limit expenses via config              | Reduces audit risk                  |
| Enable reminders for follow-up surveys | Captures feedback efficiently       |
| Link events to accounts & calls        | Unified 360° view of HCP engagement |

Would you like:

- A sample **event configuration template**?
- A walkthrough of **event approval workflow setup**?
- Custom **Apex triggers or flows** for automating spend limits?

Let me know how deep you want to go into setup or reporting!

## veeva best practices and tips

Here are the **best practices and tips** for working with **Veeva CRM (Salesforce-based)** across different modules, from **configuration** to **user adoption** to **compliance**.

### 1. Configuration Best Practices

#### Use Configuration, Not Custom Code

- Use **Veeva-recommended fields, objects, and layouts**
- Avoid Apex or Visualforce unless absolutely necessary
- Rely on **Veeva CRM Settings, Page Layouts, and Multichannel Settings**

 *Example:* Instead of writing custom code to limit sample disbursement, use `Sample_Limit_vod__c` configuration object.

### 2. Data Model and Metadata

#### Stick to the Veeva Data Model

- Use standard Veeva objects like `Account`, `Call`, `Sample_Order`, `Medical_Event`
- Avoid creating parallel objects for HCPs or events

#### Use Veeva Metadata Loader

- Automates deployment of config changes (like picklist updates or object metadata)
- Ensures consistency across sandboxes and production

### 3. MyInsights Tips

#### Keep Dashboards Lightweight

- Avoid heavy or multi-layer JavaScript visualizations
- Cache static data when possible

#### Design for Reps

- Focus on **territory-specific insights**, like:
  - HCP activity
  - Call frequency
  - Brand affinity

## 4. Territory Management Best Practices

### ✓ Use Veeva Align for Large Assignments

- For big changes in HCP-to-rep assignments
- Supports bulk assignment, approval workflows, simulation, and reporting

### ✓ Avoid Manual Overwrites

- Use **Territory2** object and standard alignment tools
- Avoid hardcoded territory names or user IDs

## 5. Sample Management & Compliance

### ✓ Configure Sample Limits

- Per product, per HCP, and per time window
- Use **Sample\_Limit\_vod\_\_c** and **Sample\_Transaction\_vod\_\_c**

### ✓ Capture Signatures Digitally

- Ensure all HCPs sign the acknowledgment digitally
- Enable offline signature support in iRep

### ✓ Use BRC When Needed

- Use **Business Reply Cards (BRCs)** when HCPs cannot receive samples in person

## 6. Approved Email Tips

### ✓ Only Use MLR-Approved Content

- Never allow free-text emails
- Use pre-approved email fragments (e.g., **Email\_Template\_vod\_\_c**)

### ✓ Schedule Email Approvals in Advance

- Approval process can take time — plan ahead with MLR/Compliance

## 7. iRep Offline Best Practices

### ✓ Minimize Sync Time

- Avoid heavy MyInsights dashboards for mobile

- Use **Incremental Sync** whenever possible

## ✓ **Test Offline Functionality**

- Simulate offline workflows for:
  - Call reporting
  - Signatures
  - Event check-in
  - Account lookup

## **8. Reporting & Dashboards**

### ✓ **Standardize KPIs**

- Examples: % HCP coverage, # of calls per rep, Sample volume, Email open rate

### ✓ **Use Veeva CRM Analytics or MyInsights**

- Build performance dashboards tailored to user roles (field rep vs. manager)

## **9. End-User Engagement**

### ✓ **Provide Role-Based Training**

- Reps: Call Reporting, iRep, Account Management
- Managers: Coaching Reports, Territory Coverage
- Admins: Configuration, Reports, Metadata Loader

### ✓ **Use In-App Help or Embedded Guides**

- Include tooltips or mini-videos embedded in the app

## **10. Compliance and Audit Readiness**

### ✓ **Enable Audit Trail**

- For key objects like Call, Sample Order, Medical Event

### ✓ **Automate Compliance Reports**

- Use scheduled reports for:
  - Off-label discussions
  - Sample limits breached

- Unapproved emails sent

## Bonus: Integration Tips

### ✓ Salesforce Integrations:

- Use Veeva Web Services API or Veeva Vault API for external integrations
- Examples: integrate with ERP (for order tracking), LMS (training), or MDM (HCP master data)

### ✓ Align with Vault:

- Link Veeva CRM to **Vault PromoMats** for pushing approved content to CLM
- Link with **Vault MedComms** for medical literature access

## Summary Table

| Category             | Best Practice                                  |
|----------------------|------------------------------------------------|
| Configuration        | Use standard Veeva objects & metadata loader   |
| Sample Management    | Digital signature + Sample limits              |
| Territory Assignment | Use Align for bulk changes                     |
| Email                | Only approved templates & fragments            |
| Reporting            | MyInsights for real-time visual reports        |
| Compliance           | Audit trail, pre-approvals, approval workflows |
| Offline Usage        | Regularly test iRep features in offline mode   |
| End-User Support     | Training, contextual help, use cases in guides |

information on upcoming veeva migration to vault

Here's an in-depth overview of the **upcoming migration from Veeva CRM (Salesforce-based) to Vault CRM**, including timelines, key benefits, migration considerations, and what organizations should prepare for.

## What Is Veeva Vault CRM?

Vault CRM is Veeva's **new, purpose-built CRM** built entirely on the **Veeva Vault platform**. It brings together sales, marketing, medical, and service functions into a unified Vault-based environment, eliminating dependency on Salesforce infrastructure.

[Veeva Systems+15](#)

[PR Newswire+1](#)

It includes:

- **Vault CRM Service Center** for inside and hybrid sales teams
- **Campaign Manager** for coordinated multichannel marketing
- More rapid innovation potential (AI Bot, voice control)

[PR Newswire+11](#)

## Migration Timeline

- **April 2024:** Vault CRM became available for **new customers**.  
[Veeva Systems+2](#)
- **Early 2025:** Migration programs began for **smaller existing customers**.
- **2026–2029:** Majority of **large Veeva CRM clients** will migrate.  
[Clarkston Consulting+6](#)  
[Veeva Systems+15](#)
- **By end of 2025:** At least one of the *top 20 global pharma* companies is expected to complete migration.  
[AInvest+6](#)
- **September 2025:** Veeva is scheduled to fully **decouple from Salesforce**, ending their long-standing licensing agreement. [Investors.com+1](#)

Veeva CRM (Salesforce edition) will be supported through **September 2030**, with updates focused on stability and compliance.  
[Veeva Systems+15](#)

## Why Migrate to Vault CRM?

- **Integrated life sciences data model**—unified across Sales, Marketing, Medical, and Service teams.  
[PR Newswire+3](#)
- **Faster innovation**—control over UI and platform means quicker feature releases (e.g. AI support, CRM Bot).  
[Veeva Systems+2](#)
- **Lower customization complexity**—less need for Apex/VF; Vault uses Java-based extensions.  
[Clarkston Consulting+6](#)
- **Seamless cross-product integration**—promo content (PromoMats), medical content (MedComms), events, sampling, etc. all under Vault. [Veeva SystemsPR Newswire](#)

## How Migration Works: At a Glance

| Phase              | Description                                                                                                |
|--------------------|------------------------------------------------------------------------------------------------------------|
| Data sync & export | Current Veeva CRM data (Accounts, Calls, Calls, Samples) is extracted and translated into Vault data model |
| Metadata mapping   | Page layouts, picklists, settings are mapped to Vault equivalents                                          |

| Phase               | Description                                                                                                           |
|---------------------|-----------------------------------------------------------------------------------------------------------------------|
| Customization audit | Review any proprietary objects or Apex; port to Java or remove if obsolete.<br><a href="#">Clarkston Consulting+7</a> |
| Vault sandbox test  | User acceptance and testing in Vault sandbox environment                                                              |
| Go-Live & training  | Training for end-users on new UI; Migration go-live rolled out by region                                              |

Veeva promises to **manage much of the migration automation**, especially for standard objects and features—minimizing customer effort. [Assemble Studio+9](#)

## Real-World Adoption Examples

- **GSK, Novo Nordisk, Bayer and Merck** are among the top firms **committing to migrate fully**, with Merck signing on in mid-2025. [AInvest](#)
- As of mid-2025, **over 80 implementations are live**, with **28 new customers onboarded in Q1 FY26**. [Seeking Alpha+1](#)

## Migration Preparation: What You Should Do

### 1. Audit Customizations

- Identify custom objects, Apex code, Visualforce/Lightning components that may require translation or removal. [Assemble StudioClarkston Consulting](#)

### 2. Simplify Metadata

- Reduce unused picklists, record types, custom fields before migration.

### 3. Plan Training & Change Management

- Though core desktop and iPad behavior remains similar, Vault CRM UI has some differences that should be communicated to end users.

### 4. Test in Vault Sandbox Early

- Validate business-critical scenarios like Call Reporting, Territory Management, CLM, and Sample Management.

### 5. Integrations

- Reconfigure third-party integrations (ERP, Veeva Vault, LMS, Network) as they may need new API endpoints.

## Key Milestones Overview

| Milestone                   | Timing     |
|-----------------------------|------------|
| Vault CRM GA (New clients)  | April 2024 |
| Pilot migrations begin      | Early 2025 |
| Major enterprise migrations | 2026–2029  |

| Milestone                  | Timing               |
|----------------------------|----------------------|
| Salesforce dependency ends | September 2025       |
| Full support of legacy CRM | Until September 2030 |

## Business Benefits Post-Migration

- **Unified Vault Platform** across all teams (Sales, Marketing, Medical, Service)
- **Rapid new feature rollout** especially in AI and analytics
- **Consistency** across iPad and Web UI
- **Lower IT complexity** as Vault handles infrastructure

Many leaders forecast the shift will free teams to **focus on customer-centric innovation** rather than underlying platform quirks.

TSF, ADDRESS, Account, Merge in detail with multiple examples and explain all the examples

Here's a detailed breakdown of **TSF (Territory Specific Fields)**, **Address**, **Account**, and **Merge** in Veeva CRM with **multiple real-world examples** and thorough explanations:

## 1. TSF – Territory Specific Fields

### Definition:

TSFs allow field-level customization **per territory** for the **same account**. They store data **specific to a territory**—like call plan status, product targeting, or segmentation—without duplicating the account.

### ♦ Use Case:

A healthcare provider (HCP) may belong to **multiple sales territories**, but reps need to manage **territory-specific strategy**, like:

- Tiering
- Targeting status
- Product priority

### ✓ Example 1: Targeting Field

plaintext

Dr. Smith is a cardiologist in Boston and appears in:  
- Territory A: Boston Metro  
- Territory B: New England Hospital Group

Each territory wants to track if Dr. Smith is **targeted for a specific product**:

| TSF Field        | Territory A | Territory B |
|------------------|-------------|-------------|
| Targeted_Product | "Product X" | "Product Y" |
| Call_Plan_Status | "Active"    | "Inactive"  |

This is achieved using **TSF object records**, linked to Account + Territory combination.

## 2. Address Object

### Definition:

The **Address** object holds the **location details** for an account. One account can have **multiple addresses** (office, clinic, home).

### ✓ Example 2: Multiple Addresses

plaintext

Dr. Lisa Chen:  
 - Primary practice: "HeartCare Clinic, Manhattan"  
 - Also practices at: "NYU Langone Hospital"

So, Dr. Lisa Chen has:

- **Address 1** → Manhattan clinic
- **Address 2** → NYU hospital

Reps can log calls, CLM, and samples to a **specific address** via the **Call** object → **Address\_vod\_\_c** field.

 **Address Territory Validation:** Veeva validates if the selected address belongs to the **rep's territory** during call creation.

## 3. Account Object

### Definition:

Represents HCPs (Health Care Professionals), HCOs (Health Care Organizations), or pharmacies. It is **central to all Veeva activity**.

### ✓ Example 3: HCP Account with TSF and Address

plaintext

Account: Dr. Ravi Patel (Cardiologist)

- Practice Locations:
  - Address 1: Apollo Hospital (Mumbai)
  - Address 2: Fortis Hospital (Pune)
- Territories:
  - Territory A: Mumbai
  - Territory B: Pune

For each combination, you will have:

- One **Account** object (Dr. Patel)
- Two **Address** records (Apollo & Fortis)
- Two **TSF** records (1 per territory)

This supports **multi-territory alignment** and **local strategy**.

## 4. Account Merge

### Definition:

Merge removes **duplicate account records**, combining their:

- **Activities (Calls, CLM, Events, Surveys)**

- **Addresses**
- **TSF**
- **Child records (e.g., affiliations)**

## Types of Merges:

- **User Merge:** Done manually via UI by an admin or data steward.
- **Auto Merge:** Performed using Veeva Network or custom logic with match rules.

## Example 4: Manual Merge

plaintext

Duplicate 1:

- Dr. Sara Jones
- Address: 123 Main St
- TSF: Territory A

Duplicate 2:

- Dr. Sarah Jones
- Address: 123 Main Street
- TSF: Territory A, Territory B

Merged Result:

- **One Account:** Dr. Sara(h) Jones
- **Consolidated Address:** 123 Main Street
- **TSF Records:** Kept both for Territory A and B
- **All call history, samples, surveys transferred**

## Example 5: Auto Merge via Veeva Network

Network identifies two records as the **same HCP** using:

- Name
- NPI / MCI / License #
- Specialty
- Geo-location

A merge job is triggered:

- One record is kept as **master**
- All references (calls, tasks, TSF, events) are **migrated**
- Duplicate is marked **inactive**

 **Precaution:** Merges are **non-reversible** and must be tested in sandbox before deployment.

## TSF + Address + Merge Combined Example

Let's combine them into a **full workflow**:

### ✓ Example 6: Full Workflow

```
plaintext
```

```
Account: Dr. Anjali Mehta
```

```
Territories:
```

- Territory North
- Territory West

```
Addresses:
```

- Mumbai Clinic
- Thane Clinic

```
TSF Fields:
```

- Targeted (Yes/No)
- Product Priority (A/B/C)

```
Duplicate Accounts:
```

- Anjali Mehta (Mumbai)
- A. Mehta (Thane)

#### □ Steps:

##### 1. TSF setup:

- Mumbai = Targeted: Yes, Priority: A
- Thane = Targeted: No, Priority: C

##### 2. User logs calls to each location (via address).

##### 3. Veeva Network detects duplicate and merges both.

##### 4. Post-merge:

- One unified account
- Both addresses retained
- TSF preserved for both territories
- Activity history remains intact

### ✓ Summary Table

| Feature        | Description                               | Example Use Case                            |
|----------------|-------------------------------------------|---------------------------------------------|
| <b>TSF</b>     | Territory-specific data for an account    | Product priority in Territory A vs B        |
| <b>Address</b> | Multiple practice locations for one HCP   | Call logging at correct location            |
| <b>Account</b> | Central HCP or HCO entity                 | Linked to Calls, TSF, Address, Surveys      |
| <b>Merge</b>   | Eliminates duplicates and retains history | Combining "Dr. Ravi P." with "Dr. R. Patel" |

Would you like a visual diagram showing how TSF, Address, and Account relate in Salesforce schema? Or do you want a Salesforce SOQL example for fetching TSFs per territory?

Let me know and I can generate it!

My Schedule, Calendar in detail

Here is a **detailed explanation of "My Schedule" and "Calendar"** in **Veeva CRM**, including how they work, their components, and **real-life pharma sales rep examples**:

## What is "My Schedule" in Veeva CRM?

**"My Schedule"** is a **calendar-based planning tool** in Veeva CRM used by field reps (like Medical Representatives or Sales Reps) to:

- Plan and schedule **HCP (Doctor) visits**
- View upcoming and past **calls/activities**
- Meet **call objectives**
- Align their day-to-day schedule with **territory goals**

Think of "My Schedule" as a smart calendar tailored for pharmaceutical field reps.

## Key Features of My Schedule

| Feature                      | Description                                                             |
|------------------------------|-------------------------------------------------------------------------|
| <b>Calendar View</b>         | Daily, Weekly, or Monthly layout of scheduled calls                     |
| <b>Drag-and-Drop</b>         | Easily move HCP appointments to different days                          |
| <b>Color Coding</b>          | Identify different types of activities (e.g., calls, meetings, lunches) |
| <b>Call Objectives Panel</b> | Shows planned vs. completed calls                                       |
| <b>Territory Filtering</b>   | View based on assigned territories                                      |
| <b>Offline Support</b>       | Available on iRep (iPad), works offline and syncs later                 |

## Example Scenario: Daily Life of a Medical Rep Using My Schedule

**Rep Name:** Priya

**Territory:** South Mumbai

**Products:** CardioX, BPStat

**Target Accounts:** 15 doctors

### ♦ Step-by-Step Usage:

### 1. Start of the Week:

- Priya opens **My Schedule** on iPad.
- She sees her **call plan for the week**, including doctors she must visit.

### 2. Scheduling Calls:

- Monday 10 AM: Dr. Mehra (Cardiologist, Bandra)
- Tuesday 2 PM: Dr. Sharma (General Practitioner, Dadar)
- She **drags and drops** these HCPs from the call objectives panel into specific time slots.

### 3. During Field Visits:

- At 10 AM on Monday, she meets Dr. Mehra.
- Opens Dr. Mehra's profile from calendar → Logs a **Call Report** → Details CardioX → Records samples given → Syncs data.

### 4. Missed Visit:

- Dr. Sharma cancels appointment.
- Priya moves the call to **Thursday 3 PM** with a single drag.

## Calendar Integration in Veeva

- **Month View:** Overview of all scheduled and completed calls.
- **Week View:** More granular planning, including travel time.
- **Day View:** Actionable detail of all planned interactions.

### Custom Settings in Calendar:

Admins can configure:

- **Start & End hours** of the rep's day (e.g., 8 AM to 6 PM)
- **Working Days**
- **Call Capacity Limits** per day or week

## Call Objectives Integration

Your calendar is **not just visual** — it aligns with **targeting strategy**.

Example:

- Target: 10 calls/week on CardioX
- Completed: 6 calls so far
- My Schedule will **highlight** remaining calls needed to meet quota

## Real-Life Offline Use Case (iRep on iPad)

1. Priya is in a rural area with no internet.
2. She opens My Schedule **offline** and completes:
  - 3 doctor visits
  - 3 call reports
  - 1 CLM presentation
3. Once back online, all activities **auto-sync** to the server.

## Admin/Manager Use Cases

- **Managers** can access rep calendars to:
  - Monitor productivity
  - Suggest rescheduling
  - Track call compliance
- **Admins** can:
  - Configure available views
  - Customize UI labels (e.g., change "My Schedule" to "Rep Calendar")

## Benefits of My Schedule

| Benefit                     | Description                                     |
|-----------------------------|-------------------------------------------------|
| <b>Productivity</b>         | Reps plan their day efficiently                 |
| <b>Targeting Compliance</b> | Ensures reps meet call plans and goals          |
| <b>Flexibility</b>          | Easy to adjust plans based on real-time changes |
| <b>Transparency</b>         | Managers see what reps are doing                |
| <b>Integration</b>          | Syncs with TSF, Call Reports, CLM, Address data |

## Related Veeva CRM Objects

| Object                | Description               |
|-----------------------|---------------------------|
| <b>Call</b>           | The actual visit record   |
| <b>Territory</b>      | Scope of rep's coverage   |
| <b>TSF</b>            | Territory-specific data   |
| <b>Account</b>        | HCPs, HCOs                |
| <b>Call_Objective</b> | Linked to call plan goals |
| <b>Activity_vod</b>   | Supports meetings, tasks  |

# Summary

## "My Schedule" = Smart Calendar + Call Planner + Target Tracker

It helps field reps organize their days, meet call goals, and adapt quickly—all within a seamless, intuitive UI on web and iPad.

Would you like a **sample screenshot layout** or a **click-through demo deck** for "My Schedule" to train your team? I can create that for you.

### Products and My Setup

Here's a detailed explanation of **Products** and **My Setup** in **Veeva CRM**, with practical examples and real-world usage, especially from the perspective of a Medical Representative or Sales Operations team.

## PRODUCTS in Veeva CRM

### What Are Products?

In **Veeva CRM**, **Products** refer to:

- **Pharmaceutical drugs** or **medical devices** that a rep details/promotes during an HCP visit.
- These are **configured in the system** so that reps can log product interactions, present CLM content, distribute samples, or track call performance per product.

### Product Object Structure

| Field                | Purpose                                           |
|----------------------|---------------------------------------------------|
| <b>Product_vod</b>   | Master product name (e.g., CardioX)               |
| <b>Detail_Group</b>  | Category/therapeutic group (e.g., Cardiovascular) |
| <b>Product_Type</b>  | Sample, Detail, Device, Service, etc.             |
| <b>Status</b>        | Active/Inactive                                   |
| <b>Product_Order</b> | Display order for CLM/Call screens                |

### Example Use Case: Detailing

**Priya** is a rep promoting **CardioX** and **BPStat**.

1. In her Veeva app, she schedules a call with **Dr. Mehra**.
2. During the call, she:
  - Selects "**CardioX**" from the list of available products.
  - Records **CLM presentation** and detailing feedback.

- Distributes **samples** if allowed.
3. This data is logged in the **Call Report**, associated with the **Product\_vod\_\_c** object.

## Reporting Based on Products

- **Managers** can track:
  - Which products are being promoted the most
  - How many samples are distributed
  - Which HCPs are targeted for which products

## MY SETUP in Veeva CRM

### What is My Setup?

**My Setup** is a **user-specific configuration section** in Veeva CRM, typically used to:

- Control **territory alignment**
- Assign **product visibility**
- Manage **rep-specific access and preferences**

It's a **read-only view** for the rep but **admin-controlled**.

### Key Sections in My Setup

| Section                         | Description                                              |
|---------------------------------|----------------------------------------------------------|
| <b>Territories</b>              | Lists territories assigned to the rep                    |
| <b>Product Access</b>           | Which products the rep can detail or sample              |
| <b>Multichannel Permissions</b> | Access to CLM, Approved Email, etc.                      |
| <b>Call Channels</b>            | Allowed communication types (face-to-face, video, email) |
| <b>TSF Records</b>              | Rep-specific product-to-territory relationships          |

### Real Example: My Setup for a Rep

**Rep Name:** Ankit

**Assigned Territory:** East Delhi

**Products:** DiabeSure, SugarAway

**Channels Enabled:** In-person, Approved Email

In Ankit's **My Setup** screen, he sees:

- His **territory ID and name**
- The products he's allowed to detail and sample
- Whether he's enabled for **CLM or email outreach**

- His **TSF records**, ensuring he only targets relevant HCPs

## Admin Use Case:

**Admins** configure My Setup through:

- **Data Load (CSV/XLS files)**
- **Salesforce Data Loader**
- **Manual assignments via the Admin Console**

Admins manage:

- Which reps get which products
- Who can use which channels
- How call objectives link to territory-product-HCP (TSF)

## Summary

| Feature     | Products                                | My Setup                               |
|-------------|-----------------------------------------|----------------------------------------|
| What it is  | Configured drugs/devices to promote     | Rep-specific configuration screen      |
| Used by     | Reps, Sales Ops, Brand Teams            | Reps (view-only), Admins (editable)    |
| Example Use | Log samples, detail products, track use | Assign territories, set product access |
| Related To  | Call Reports, CLM, Sample Mgmt          | TSF, Product Access, Multichannel      |

Would you like a **training deck-style visual breakdown** of Products vs My Setup or example data templates for setup (e.g., TSF, Product\_vod)? I can prepare those for you.

Product Metrics Configuration

## Product Metrics Configuration in Veeva CRM

(Complete Guide with Examples)

### What Are Product Metrics?

**Product Metrics** in Veeva CRM refer to the **quantitative measures** associated with each product that field reps report during calls or activities. These could include:

- Number of samples dropped
- Number of promotional aids shown
- Units distributed

- Custom KPIs (e.g., prescriptions discussed, demos given)

They are typically configured for use in:

- **Call Reports**
- **CLM Presentations**
- **Cycle Plans**
- **Reports & Dashboards**

## 1. Core Objects Involved

| Object                        | Description                               |
|-------------------------------|-------------------------------------------|
| <b>Product_vod__c</b>         | Master list of products                   |
| <b>Product_Metrics_vod__c</b> | Stores each metric related to a product   |
| <b>Call2_vod__c</b>           | The Call object where reps log activities |
| <b>Call_Product_vod__c</b>    | Junction object between Call and Product  |

## 2. Configuration Steps

### Step 1: Enable Product Metrics in Org

Enable the **Product Metrics** setting in Veeva CRM Org Configuration:

- Go to **Veeva Settings** → Search for "**Enable\_Product\_Metrics\_vod\_\_c**" → Set to TRUE.

### Step 2: Add Product Metrics

Create entries in the **Product\_Metrics\_vod\_\_c** object.

| Field                     | Example Value       | Description                           |
|---------------------------|---------------------|---------------------------------------|
| <b>Name</b>               | "Samples_Dropped"   | The type of metric                    |
| <b>Metric_Type_vod__c</b> | "Integer"           | Data type: Integer, Decimal, Picklist |
| <b>Product_vod__c</b>     | Linked to "CardioX" | Associates the metric with a product  |
| <b>Status_vod__c</b>      | "Active"            | Marks metric as available             |

### Step 3: Assign to Call Screens

Modify the **Call page layout** to include **Product Metrics** section and display related fields dynamically.

## 3. Real-Life Examples

### Example 1: Sample Drops

**Product:** CardioX

**Metric:** Samples\_Dropped = 3

### Scenario:

Rep visits Dr. Rao and gives **3 samples** of CardioX. On the Call Report screen, under Product Metrics for CardioX, rep enters "3".

### Example 2: Devices Demonstrated

**Product:** HeartMonitorPro

**Metric:** Demo\_Given = Yes (Boolean)

### Scenario:

During a hospital visit, rep gives a device demo. This metric is captured for tracking technical engagement.

### Example 3: CLM Slide Views

**Product:** SugarAway

**Metric:** Slides\_Shown = 5

### Scenario:

Rep shows 5 slides via CLM. Veeva auto-logs this metric for SugarAway on that call.

## 4. Reporting Use Cases

- **Manager Dashboards:** Show per-product engagement (e.g., "Which product had the most samples dropped this quarter?")
- **Brand Team Insights:** Understand what messages and products are resonating with HCPs.
- **Compliance:** Validate that samples were distributed within permissible limits.

## 5. Best Practices

| Tip                        | Description                                                      |
|----------------------------|------------------------------------------------------------------|
| Use standardized naming    | Ensure consistent naming across all metrics                      |
| Avoid duplication          | Don't assign the same metric multiple times to the same product  |
| Use conditional visibility | Show only relevant metrics per product on Call Reports           |
| Audit fields               | Enable field history tracking for metrics that affect compliance |
| Training                   | Train reps on how to correctly log metrics                       |

## Summary Table

| Component | Example                     |
|-----------|-----------------------------|
| Product   | CardioX                     |
| Metric    | Samples_Dropped             |
| Value     | 5                           |
| Use Case  | Call report, CLM engagement |
| Object    | Product_Metrics_vod__c      |

Would you like a **training slide deck**, **sample data sheet**, or **Salesforce Object Model diagram** for this? I can prepare that too.

Call Management configurations in detail with examples

Here's a detailed explanation of **Call Management configurations in Veeva CRM**, with practical **examples**, **object relationships**, and **best practices**.

## What is Call Management in Veeva?

Call Management in Veeva CRM is the process where **field reps log interactions with HCPs** (Health Care Professionals) or HCOs (Organizations). A **Call Report** captures:

- The HCP/HCO visited
- Date and time of interaction
- Samples/promotional materials given
- Products detailed
- Key messages delivered
- Attendees (if group or child call)
- Survey/feedback (optional)
- Signatures (for compliance)

## Core Objects Used in Call Management

| Object Name                     | Purpose                                  |
|---------------------------------|------------------------------------------|
| Call2_vod__c                    | Main Call object (log of interaction)    |
| Call_Product_vod__c             | Tracks products detailed during a call   |
| Call_Discussion_vod__c          | Tracks key messages or discussions shown |
| Sample_Order_Transaction_vod__c | Tracks sample drops (compliance feature) |
| Signature_vod__c                | Tracks HCP's signature for confirmation  |
| Call_Channel_vod__c             | Channel used: F2F, phone, email, etc.    |
| CLM_Presentation_vod__c         | Link to CLM slides shown during call     |

## Step-by-Step Call Management Configuration

### 1. Enable Call Reporting

- Set `Call_Reporting_vod__c` to `TRUE` in Veeva Settings.

- Enable **Call2\_vod\_\_c** object and its fields in profiles and page layouts.

## ✓ 2. Configure Call Page Layout

- Add fields like:
  - **Call\_Date\_vod\_\_c**
  - **Call\_Channel\_vod\_\_c**
  - **Call\_Type\_vod\_\_c** (Individual, Group, Child)
  - **Account\_vod\_\_c** Or **Child\_Account\_vod\_\_c**
  - **Detailing\_Products** (via **Call\_Product\_vod\_\_c**)
  - **Samples\_Dropped** (via **Sample\_Order\_Transaction\_vod\_\_c**)
  - **Call\_Discussion\_vod\_\_c** for messages

## ✓ 3. Configure Business Rules (Optional)

- Use **Call Validations** or **Trigger Rules** for:
  - Mandatory signature if samples dropped
  - Limit to one call per HCP per day
  - Prevent saving call without product detail

## ✓ 4. Configure Call Types

Examples:

- **Face-to-Face Call**
- **Virtual Call**
- **Group Call** (with multiple HCPs)
- **Child Call** (individual sub-call under Group Call)

You define these using picklist values in **Call\_Type\_vod\_\_c**.

## Real-Life Examples

### Example 1: Face-to-Face Call with Sample Drop

- **Rep:** Sarah
- **HCP:** Dr. Mehta (Cardiologist)
- **Products Discussed:** CardioX
- **Samples Given:** 2 packs

- **Key Messages:** Slide 1–3 shown
- **Signature Collected:** Yes

#### 👉 System Logs:

- `Call2_vod__c` record for Dr. Mehta
- `Call_Product_vod__c` → CardioX
- `Call_Discussion_vod__c` → Slide IDs
- `Sample_Order_Transaction_vod__c` → 2 packs of CardioX
- `Signature_vod__c` → Linked image

### 📌 Example 2: Virtual Call with No Samples

- **Rep:** Rohan
- **HCP:** Dr. Anita (Endocrinologist)
- **Products:** SugarAway
- **Channel:** Phone
- **Detailing:** Only messages, no samples

#### 👉 System Logs:

- `Call_Channel_vod__c` → Phone
- `Call_Product_vod__c` → SugarAway
- `Call_Discussion_vod__c` → Slides discussed

## Analytics Use Cases

- Number of calls per rep per week
- Samples distributed per product
- Key message recall vs delivery
- Rep-HCP engagement heatmaps

## Best Practices

| Best Practice                  | Description                                           |
|--------------------------------|-------------------------------------------------------|
| Conditional Layouts            | Show sample fields only when samples are selected     |
| Auto-sync to Vault             | Store signed call reports for compliance              |
| Restrict Call Editing          | Prevent changes after 24 hours (using Veeva settings) |
| Use DCR (Data Change Requests) | To update HCP information mid-call if needed          |
| Schedule via MySchedule        | Link calls to calendar events                         |

## Optional Enhancements

- **Approved Email** follow-up linked to call
- **CLM Integration** to show detailing engagement
- **Coaching Report** based on call quality
- **Survey after call** for HCP feedback

Would you like:

- ☒ A **custom call report layout template** (JSON or screenshot)
- ☒ A **training guide** for your field reps
- ☒ A **validation rule sample**

Let me know how deep you want to go.

Cycle plan configuration and MCCP

Here's a detailed explanation of **Cycle Plan Configuration and MCCP (Multichannel Cycle Plan)** in **Veeva CRM**, including real-world examples and configuration steps.

## What is a Cycle Plan?

A **Cycle Plan** is a marketing/sales plan created for a **specific period (cycle)**, usually quarterly or monthly, that outlines:

- **Target accounts (HCPs/HCOs)**
- **Call goals** per account or product
- **Channels used:** in-person, email, virtual call
- **Key messages** to be delivered

## What is MCCP (Multichannel Cycle Plan)?

**MCCP** extends the standard cycle plan to support **multiple channels** of engagement:

- Face-to-face visits
- Emails (Approved Email)
- Phone calls
- Events/Webinars
- CLM presentations (iRep)

MCCP tracks **actual vs planned activities**, helping reps and managers measure execution against the plan.

## How MCCP Works (Real-World Example)

 **Rep:** Anjali

 **Cycle:** Q3 2025

 **Plan:**

- Visit Dr. Sharma **4 times**
- Send **2 emails** about Diabetes product
- Show **CLM slides** once
-  **MCCP tracks:**
  - Total HCPs assigned
  - Target channel usage per HCP
  - Progress (%) and goal achievement

## Core Objects Used in MCCP

| Object Name                  | Purpose                                  |
|------------------------------|------------------------------------------|
| MC_Cycle_Plan_vod__c         | The overall multichannel plan for a rep  |
| MC_Cycle_Plan_Target_vod__c  | Target HCPs/HCOs in the cycle plan       |
| Call2_vod__c                 | Records actual calls (in-person/remote)  |
| Multichannel_Activity_vod__c | Logs email, CLM, virtual call activities |
| Account_vod__c               | HCP or HCO                               |

## Configuration Steps

### 1. Enable MCCP Settings

In **Veeva Settings**:

```
plaintext
MCCP_vod__c = TRUE
```

### 2. Create MCCP Cycle Plan Template

In **Salesforce**:

- Go to MC\_Cycle\_Plan\_vod\_\_c tab

- Create a new cycle (e.g., Q3 2025)
- Define start & end date
- Associate with **products, channels, message types**

### ✓ 3. Assign HCPs/HCOs as Targets

For each cycle:

- Use `MC_Cycle_Plan_Target_vod__c`
- Assign:
  - HCP Account
  - Planned # of activities per channel
  - Assigned territory or rep

### ✓ 4. Configure Channel Targets (Per Target)

For each **targeted HCP**:

- Define:
  - `Planned_Calls__c` = 4
  - `Planned_Emails__c` = 2
  - `Planned_CLM_Presentations__c` = 1

### ✓ 5. Enable Tracking

- All **Call2**, **CLM**, and **Email** records linked to accounts automatically contribute to the target's **Actuals**.

### Example Breakdown

#### ♦ Example MCCP Target:

| HCP       | Channel        | Target | Actual |
|-----------|----------------|--------|--------|
| Dr. Mehta | Face-to-Face   | 4      | 3      |
| Dr. Mehta | Approved Email | 2      | 2      |
| Dr. Mehta | CLM Slides     | 1      | 1      |

Veeva auto-updates the **progress %** based on actuals logged.

### Visualizing MCCP Progress

MCCP Dashboards (in Salesforce):

- Rep-Level: % of call plan achieved
- Product-Level: Reach vs frequency
- HCP-Level: Engagement across channels

## Business Use Case

Pharma Company wants to ensure HCPs get at least **3 touchpoints per month**.  
MCCP is configured to:

- Track all reps' activity per HCP
- Highlight under-engaged HCPs
- Guide reps to meet compliance goals

## Best Practices

| Practice                           | Description                                           |
|------------------------------------|-------------------------------------------------------|
| Use MCCP with CLM & Approved Email | Ensures all engagement is captured                    |
| Configure Validation Rules         | Block call save if targets are not aligned            |
| Sync With Veeva Align              | MCCP targets automatically updated based on territory |
| Use MCCP Dashboards                | For rep coaching, compliance, and territory planning  |
